

Polarization at HERA

POL2000
Group

V.Gharibyan

POL2000 Group

Introduction

Transverse Polarimeter (TPOL)

Longitudinal Polarimeter (LPOL)

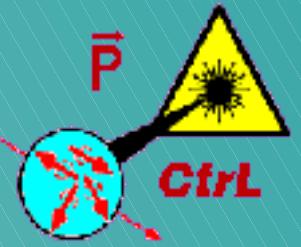

Cavity Project

Machine Aspects

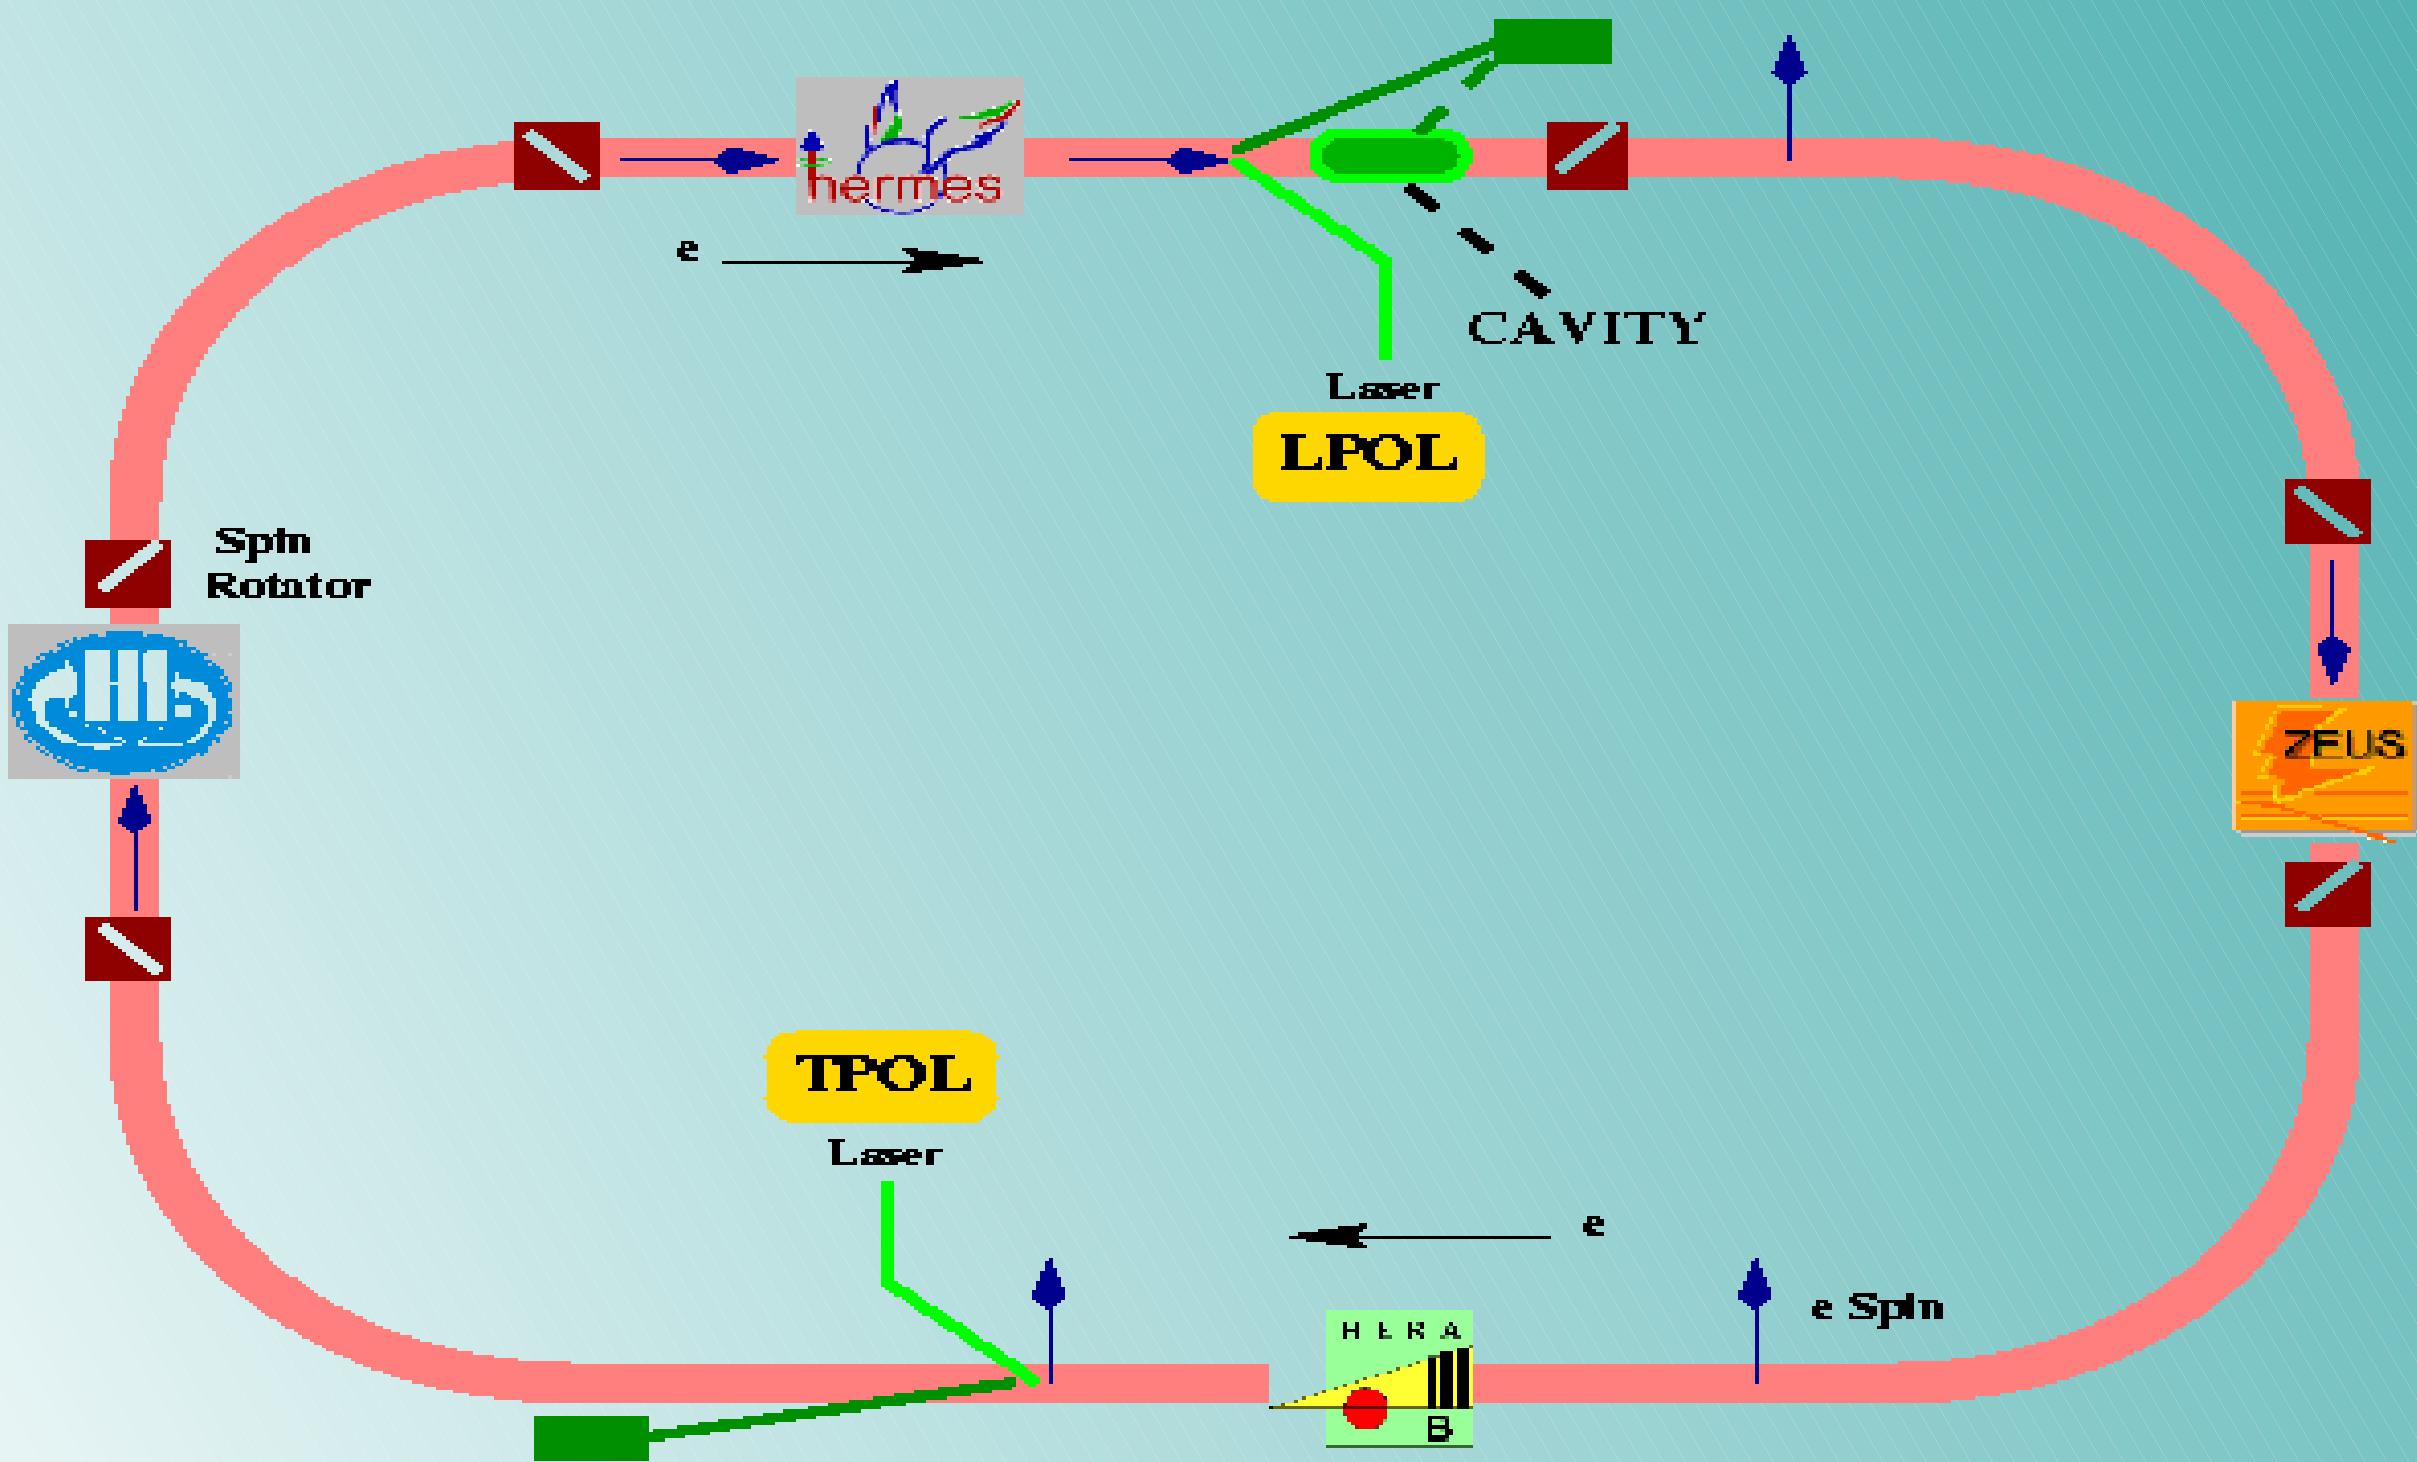

Summary

HERA II

Spin Configuration and Polarimeters

POL2000
Group

HERA Compton Polarimeters

Operating Modes and Principles

Laser Compton scattering off HERA electrons

TPOL

CW Laser - Single Photon

LPOL

Pulsing Laser - Multiphoton

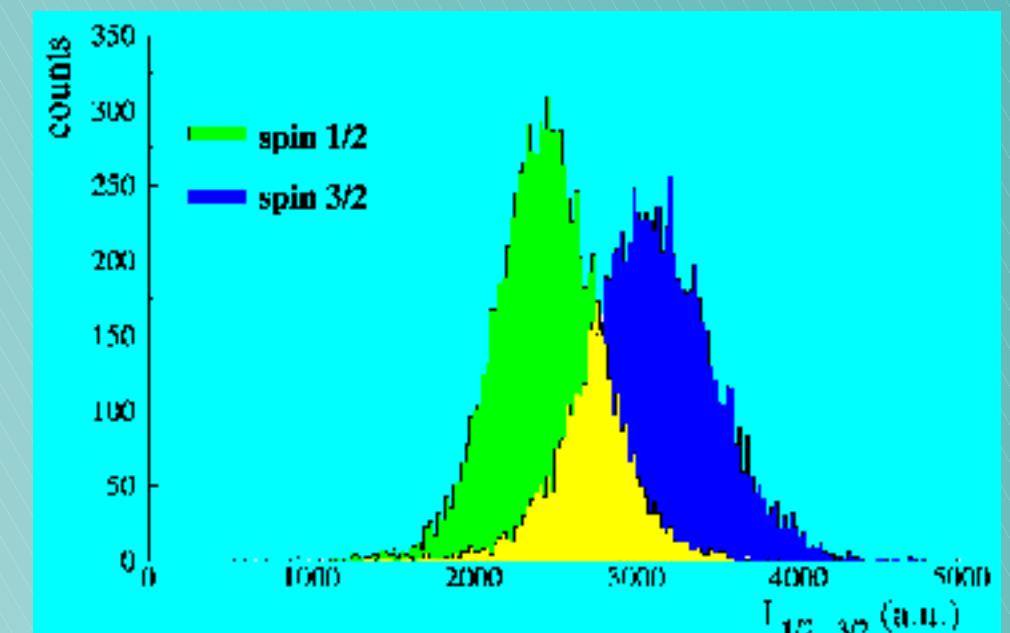

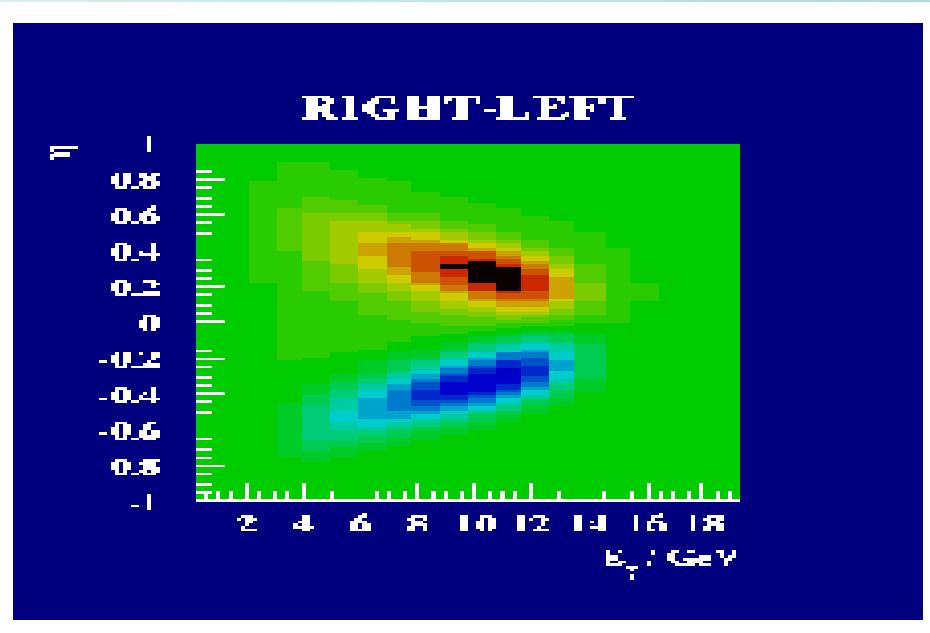

Flip laser helicity and measure scattered photons

$P_y = 0.59$

Spatial Asymmetry

$P_z = 0.59$

Helicity Dependent γ Spectra

Statistical Error $\Delta P = 1\%$ per minute @ HERA average currents

Transverse Polarimeter

Upgrade Goals

POL2000
Group

Measure bunch by bunch and Reduce systematic error

Systematics @ HERA I

Input Parameter Nominal Value	Max. and Min. Values	Resulting change in Polarisation (%)
Calorimeter Centering nominal: 0.00mm	0.03mm –0.03mm	+0.14 –0.19
Light Polarisation ΔS_1 nominal: 9%	12%	–0.34
Pedestal Position nominal: 0 ADC ch	23 ADC ch	+0.33
Electron Spot $\sigma_{e,y}$ nominal: 0.50mm	0.45mm 0.55mm	+1.10 –1.16
$\eta - y$ Transformation nominal: CERN 8 GeV	CERN 5 GeV† CERN 11 GeV	+0.69 –0.69

Improvements @ HERA II

Online $\eta-y \Rightarrow$ Converge better Silicon

Frequent Optimization with
light calorimetry
Event by event pedestals

2D fit

Online $\eta-y$

Analysis

Silicon
Sci-Fiber

	Rise-Time Measurement Rotators Off	Rise-Time Measurement Rotators On	Monte-Carlo Calculation
Analysing Power (%)	9.608	9.608	8.936
Systematic Error (%)	3.4	1.8	1.95

ALL

Transverse Polarimeter

Upgraded TPOL

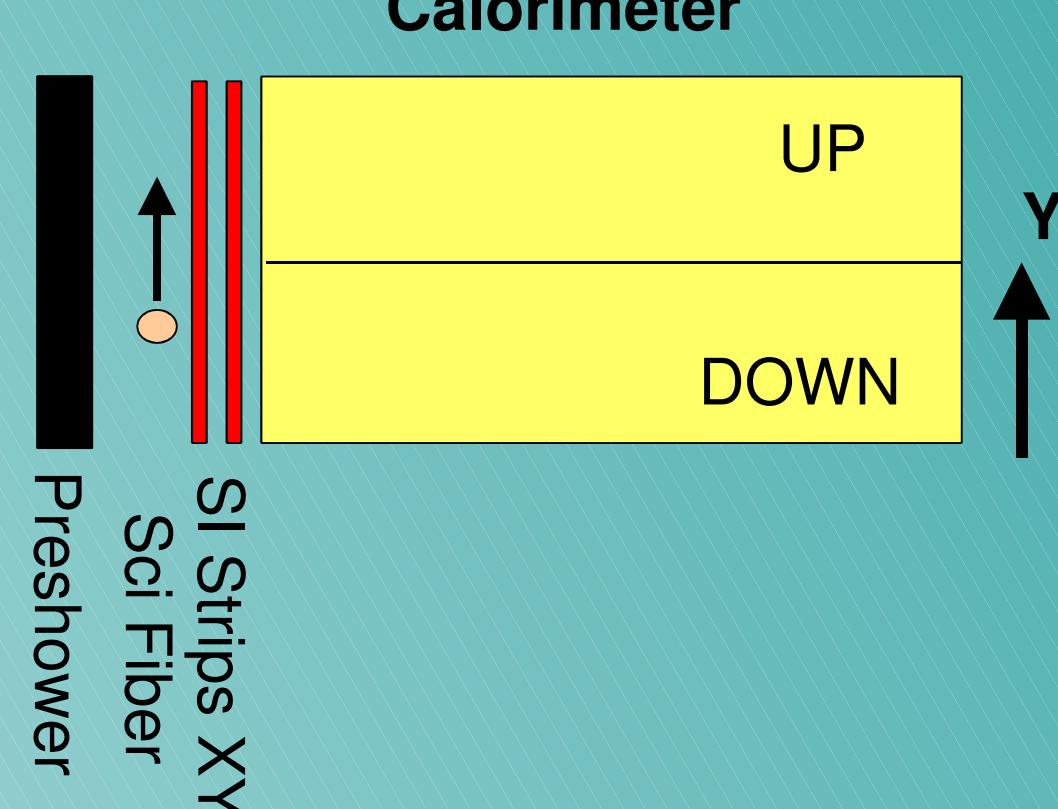

POL2000
Group

New Position sensitive detectors-
Calorimeter spatial calibration

New DAQ - measure each
bunch polarization

Compton γ Beam

Calorimeter (100kHz) Energy-Position

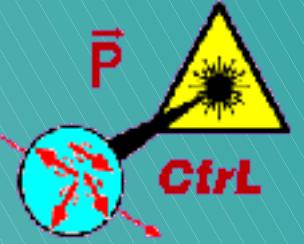

$$E_\gamma = E_{\text{up}} + E_{\text{down}}$$

$$h = (E_{\text{up}} - E_{\text{down}}) / (E_{\text{up}} + E_{\text{down}})$$

Silicon (1kHz) - Position

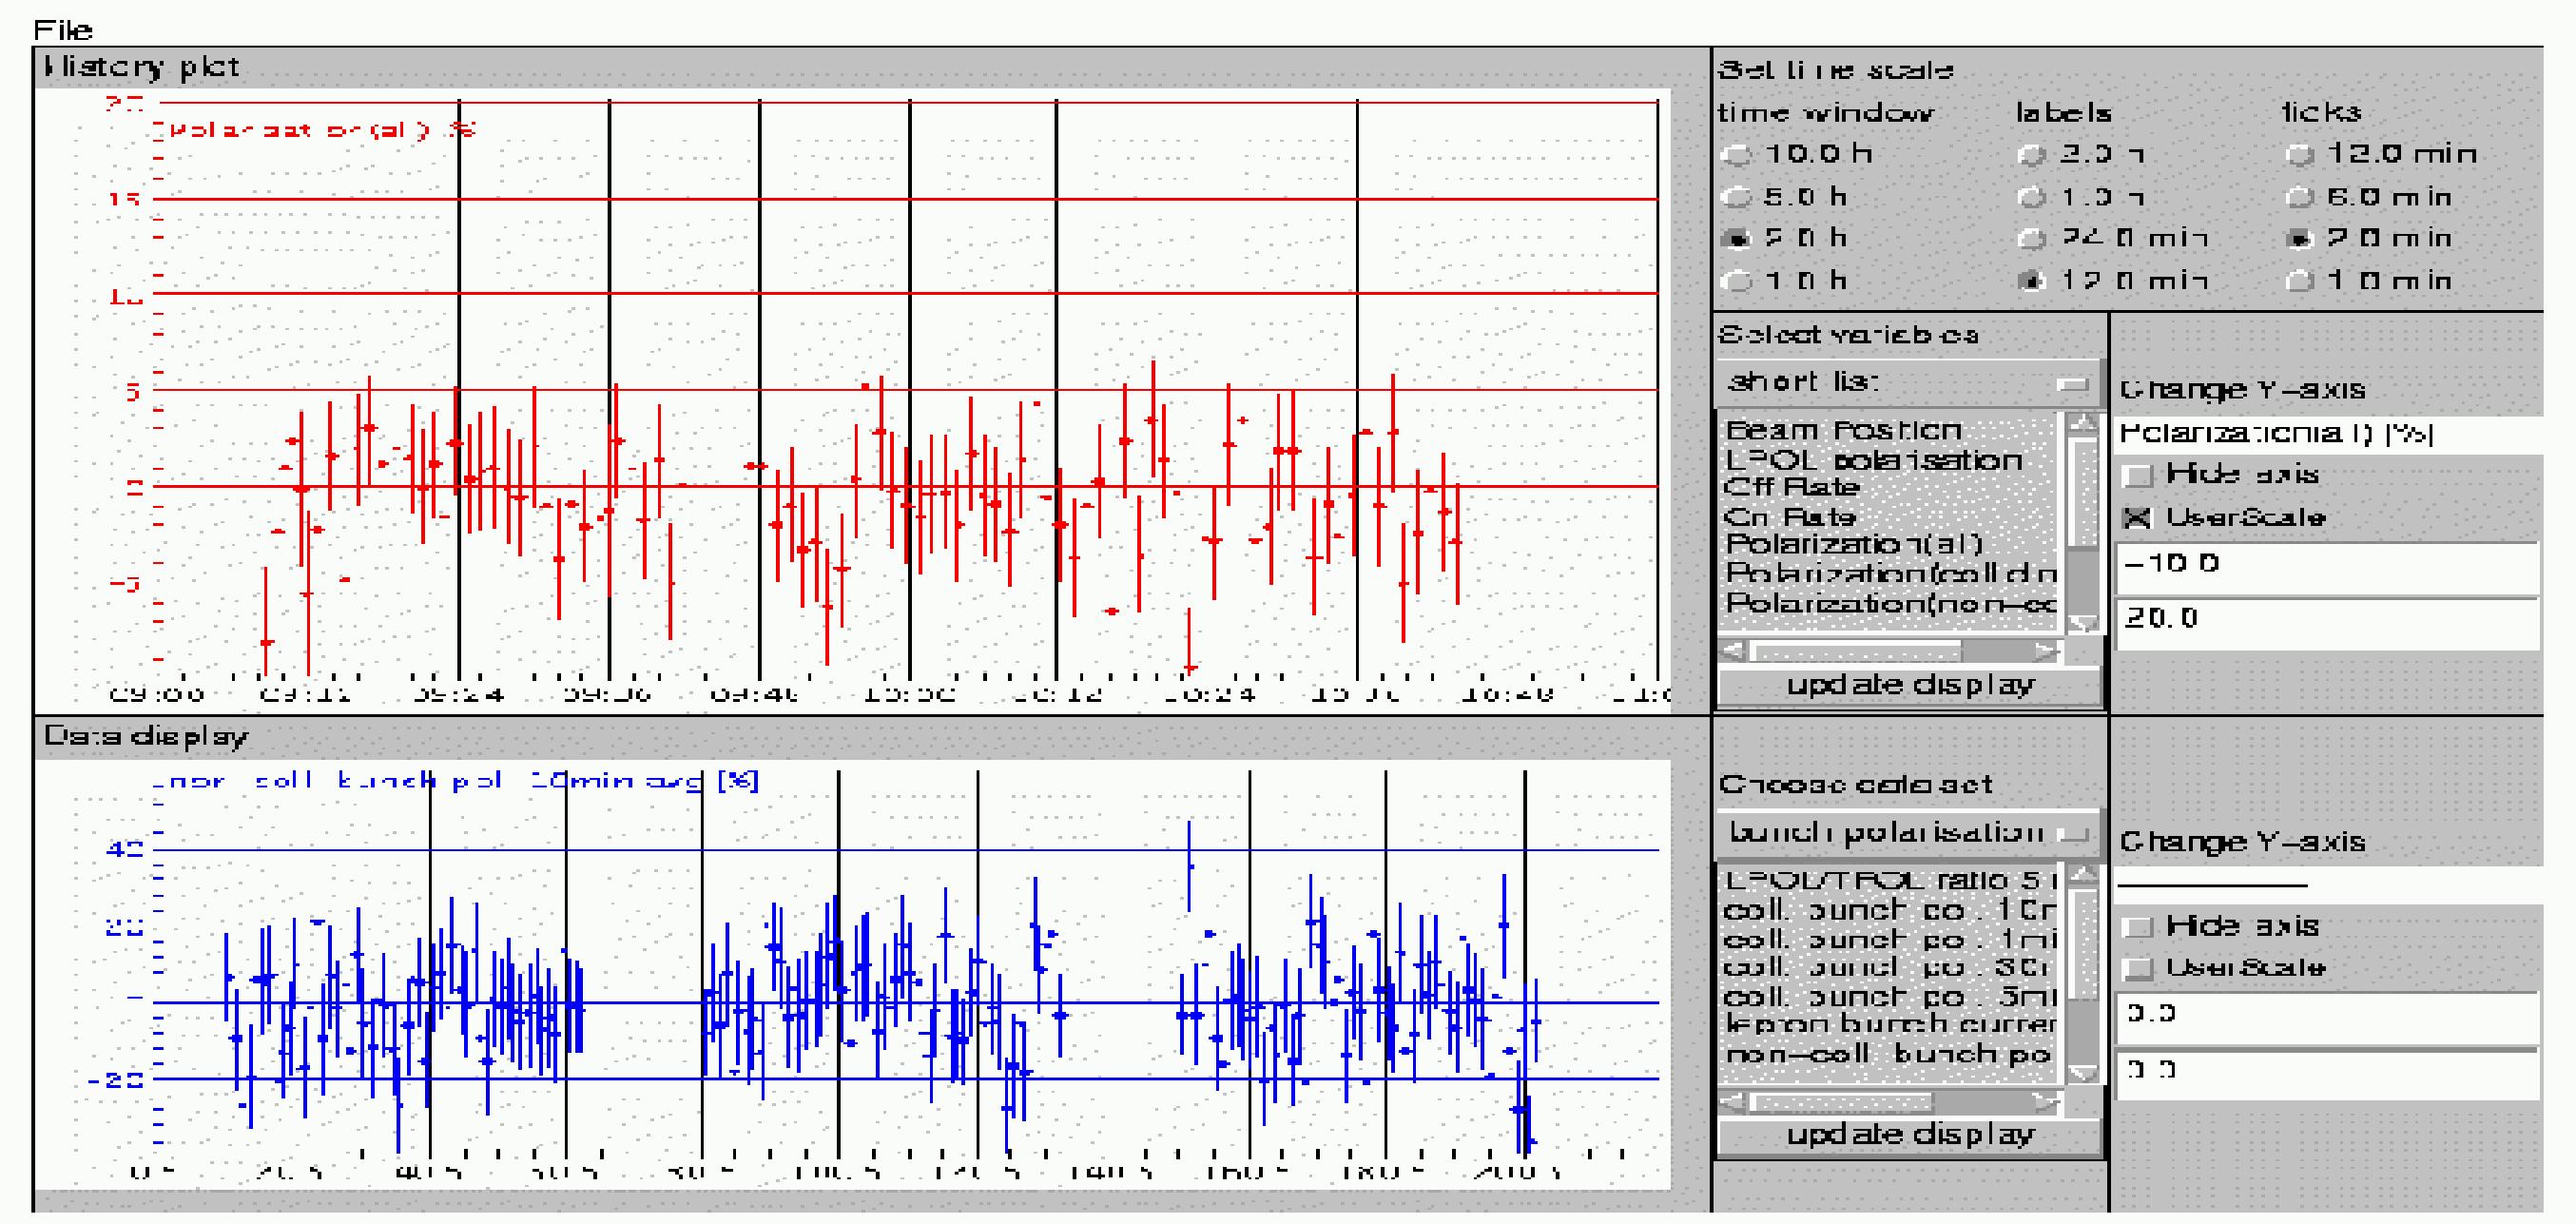

Transverse Polarimeter

Routine Operation (3 May 2002) with $I_e = 3.5\text{mA}$

2D fit
Variable
Analyzing
Power

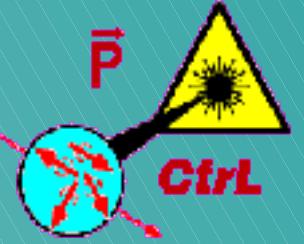

Fitted Energy Slices

Fit to MC Rise-Time

Longitudinal Polarimeter

POL2000
Group

No major changes

- Has now two calorimeters which may be used alternatively:
Crystal and Sampling with Scn. Fibers XY array in front.
- DAQ and SLOW control Software transported to faster computers.
- Online and Offline data are stored in HERA centralized database
(similar to TPOL format) available to H1 and Zeus.
- Ready for polarization measurements.

Achieved fractional systematic uncertainty 1.6%.

Nucl.Instrum.Meth.A479:334-348,2002

Upgrading to Cavity Polarimeter in progress.

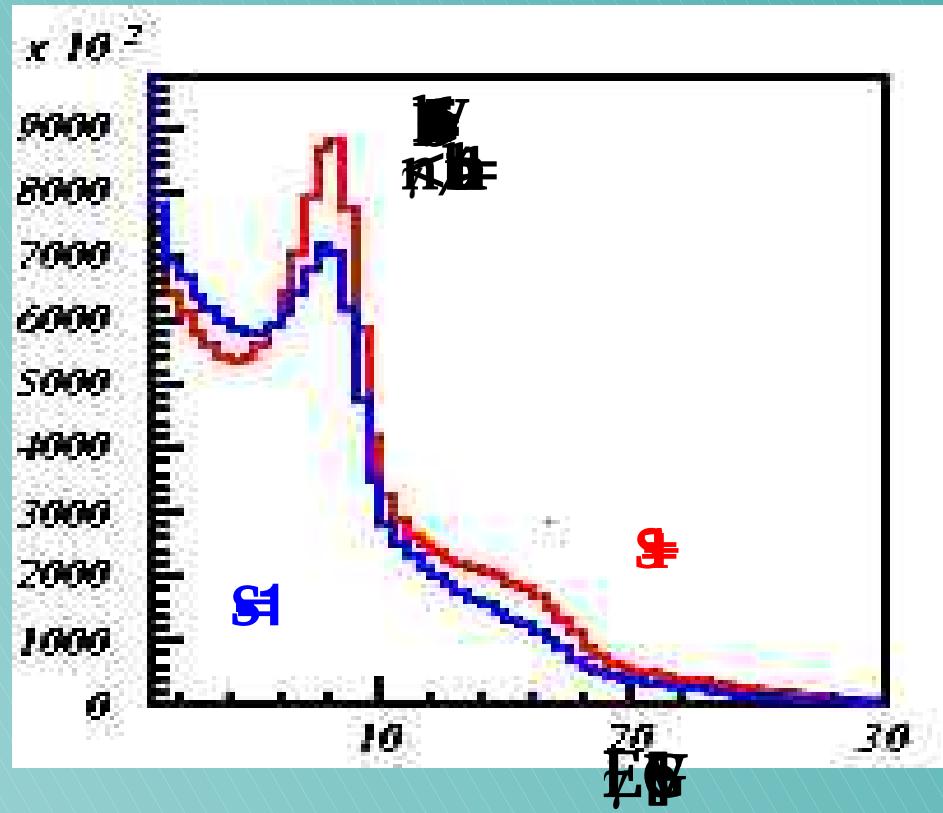

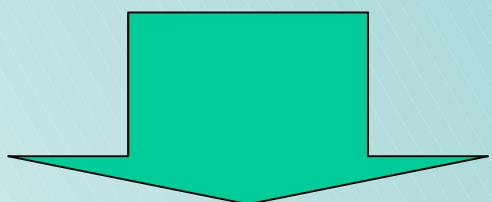

Cavity Polarimeter

Goals for LPOL upgrade

- **Reduction of systematics (<1%)**
 - **Single photon mode**
 - Absolute scale calibration using Compton Edge and Asymmetry 0 crossing.
- **Increase statistics**
 - **High laser power (cw)**

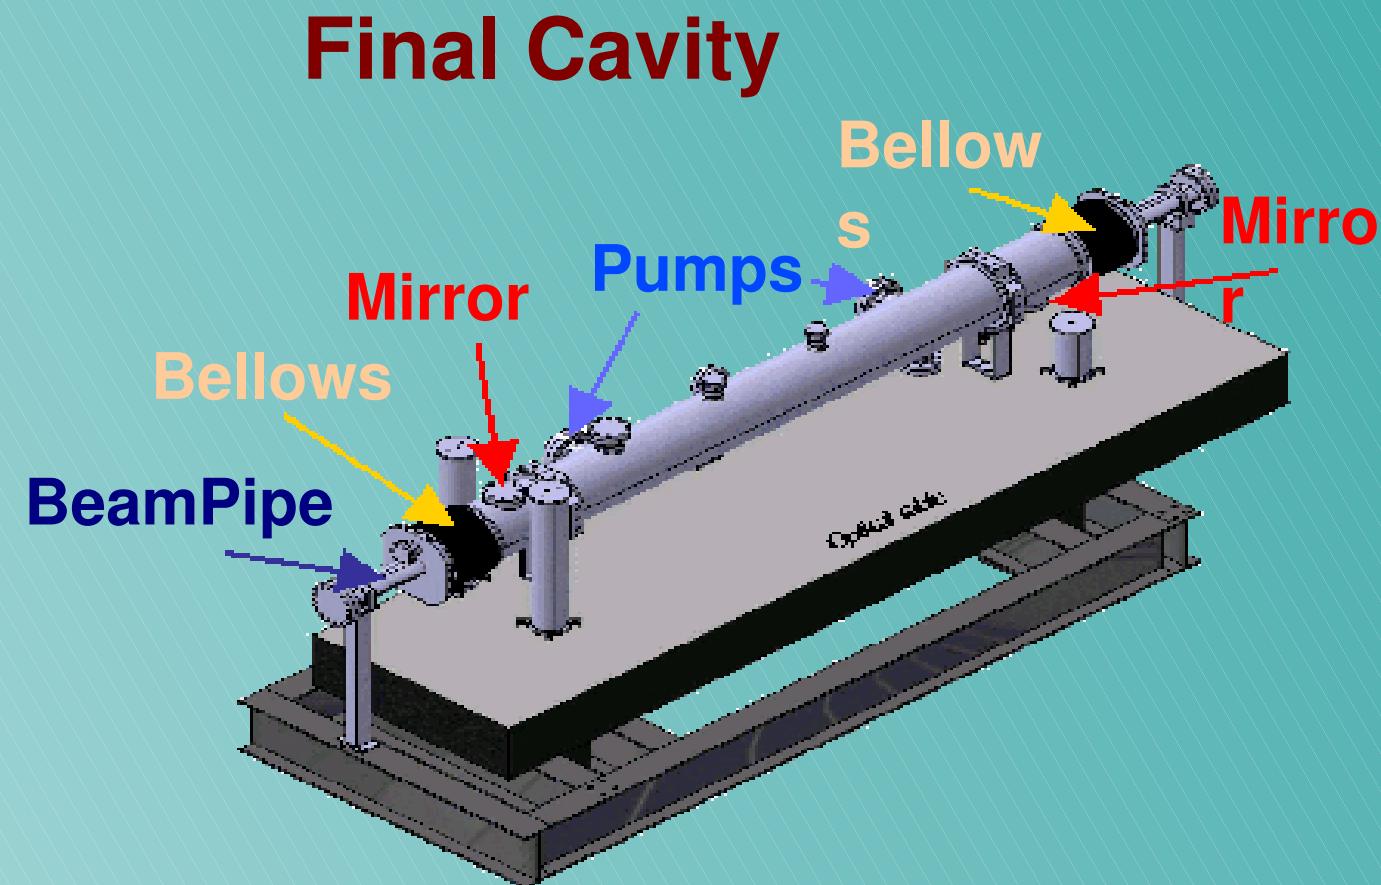

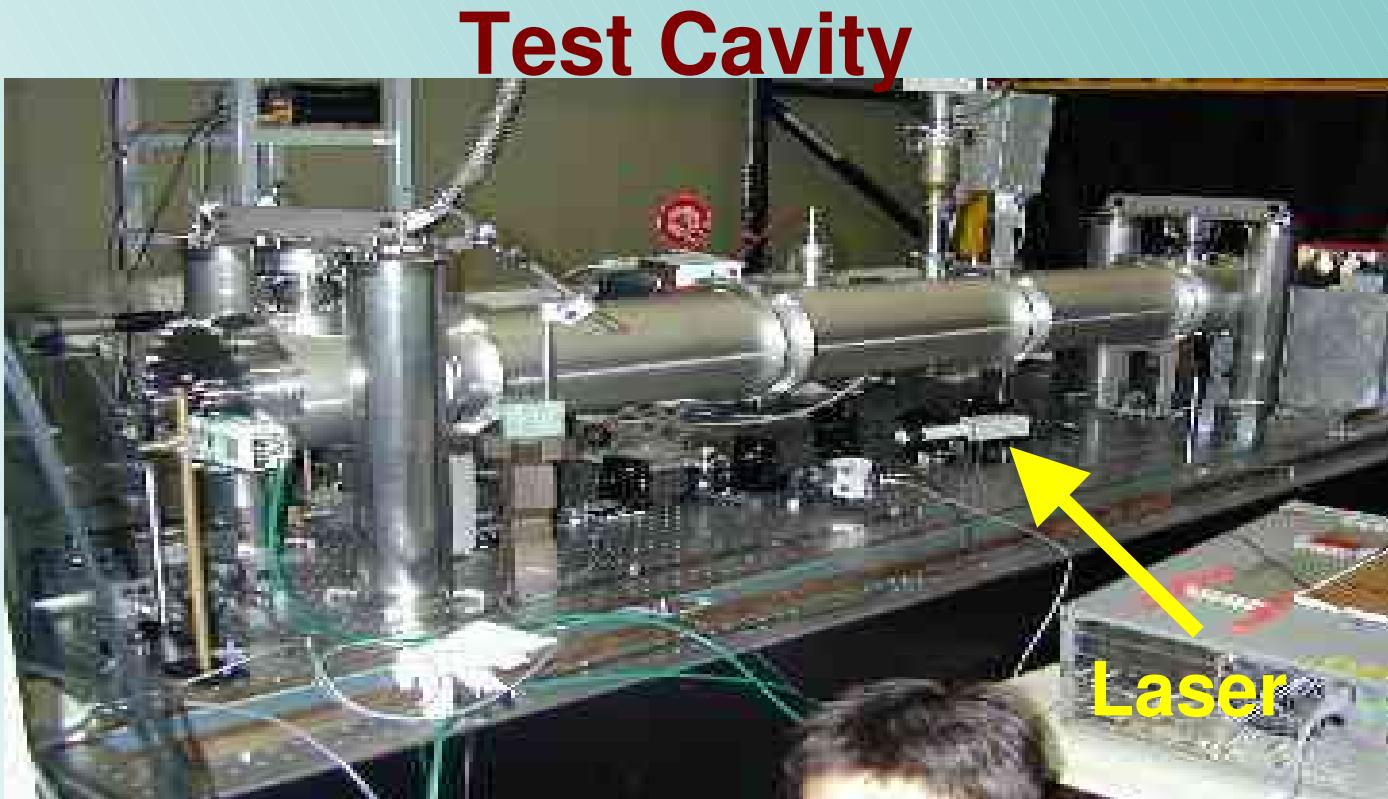

Large stat. \Rightarrow Fast measurement \Rightarrow
Fast optimisation of harmonic bumps \Rightarrow
Higher polarisation
Single bunch polarization error 1% per min

LPOL measurement in a few photon mode

Cavity Polarimeter

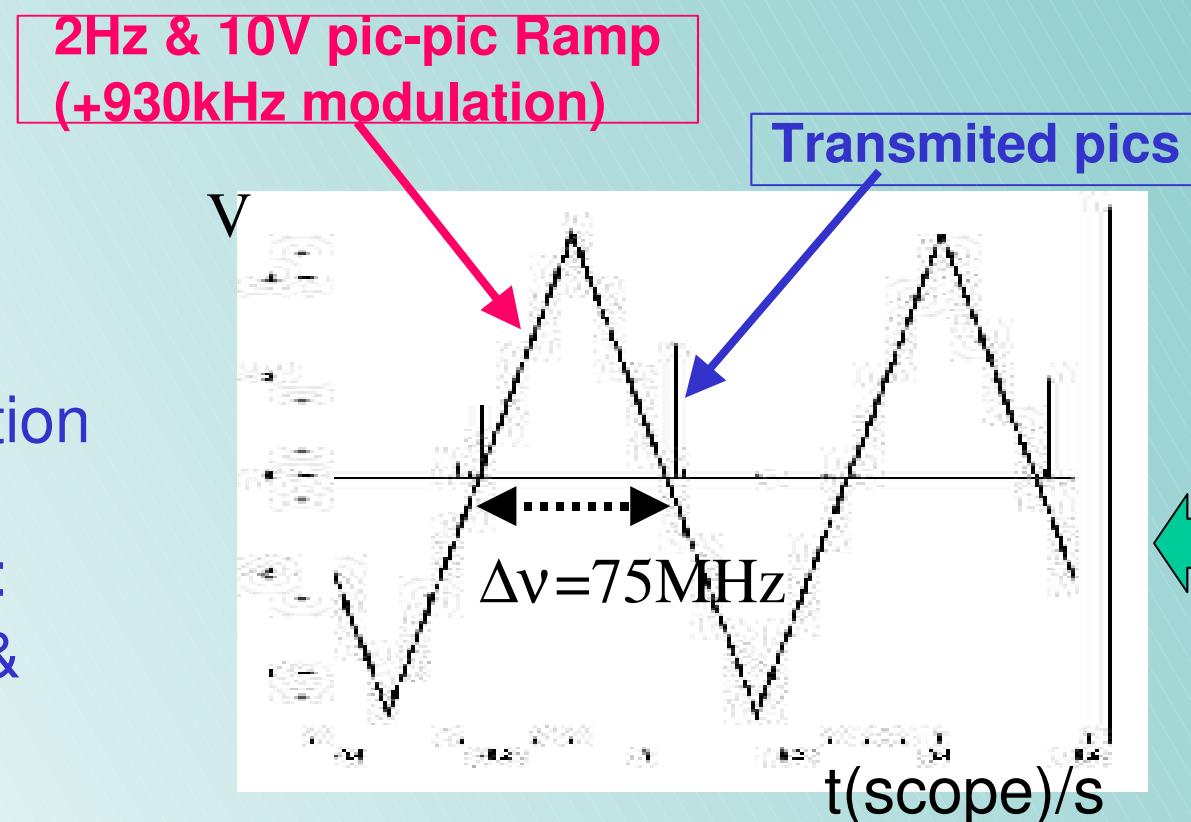

Prototype Test Cavity

Procedure:

I. 'Open loop':
ramp + modulation

II. 'Closed loop':
ramp Stopped &
servo active

Achievements

Resonance

Polarisation
Controlled at the
0.1% level

Cavity Polarimeter

Status and Timelines

POL2000
Group

- Slow control procedure (Optics) almost done
- Mechanics of Final Cavity
 - In fabrication since feb. 2002,
 - at Orsay during June 2002 ...
- Then test of the whole setup at Orsay
- Calorimeter DAQ system
 - Under development ...

Cavity installation at HERA tunnel
Machine long shutdown @ end 2002

Polarization Machine Aspects

POL2000
Group

New Spin Rotators for H1 and Zeus =>
less polarization by ~ 5%
estimate for 0.7mm orbit flatness

No anti-Solenoids =>
new compensation scheme
still to be demonstrated

Orbit Flatness Control: 1.2 → 0.7mm (RMS)
will require implementation of
Beam Based Alignment

Harmonic Bump Control
Complex Amplitudes 4 → 8 → 16
Expected Average Polarization 55% (Hera I) → 50% (HERA II)

Summary

POL2000
Group

TPOL

- successfully upgraded
- measures bunch by bunch polarization
- new Silicon and Fiber detectors providing data to reduce systematic uncertainties
- ongoing analysis to prove sub percent precision.

LPOL

- ready for polarization measurement
- **Cavity** upgrade:
- well advanced tests with full-scale prototype in Paris
- expect to be ready for installation at HERA at the end of 2002.
