HELMHOLTZ RESEARCH FOR
GRAND CHALLENGES

What are we made of?

- Particle Physics aims to understand the **fundamental building blocks of Nature** and the **interactions between them** → access the **most basic laws of Nature**

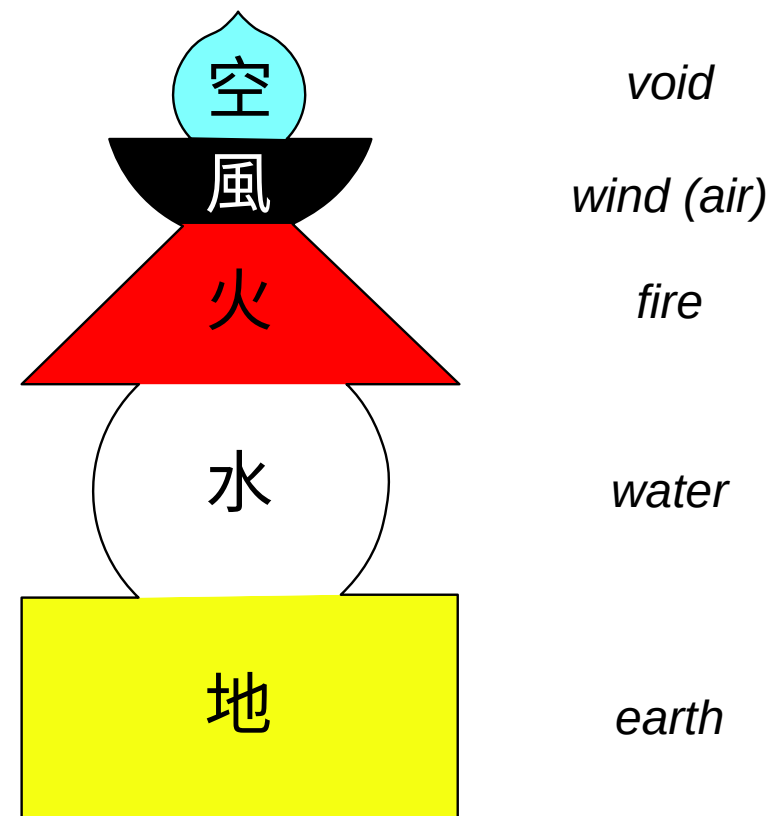

What are we made of?

- Particle Physics aims to understand the **fundamental building blocks of Nature** and the **interactions between them** → access the **most basic laws of Nature**
- Since the Antiquity, philosophers – in Ancient Greece, Tibet, Japan, Mali, etc. – have asked these questions
 - 4 (or 5) **classical elements**: earth / fire / air / water / (void)
 - From Greek: “atomos” = uncuttable

Example 1:
Classical Greek elements
(here in drawing by Leibnitz)

Example 2:
“Godai” (五大)
in Japan

 - atomic nuclei made of **protons** [Rutherford 1917-1920] and **neutrons** [Chadwick 1932]
 - zoo of subatomic particles (“*baryons*” and “*mesons*”) discovered in 1940’s and 1950’s in cosmic rays
 - understood to be made of **quarks** – theorised by [Gell-Mann 1964] and [Zweig 1964], first types discovered at SLAC in 1968

Atomic nucleus, made of **protons** and **neutrons**

Proton = 3 quarks *u, u, d*

Neutron = 3 quarks *u, d, d*

A meson (here *J/ψ* = quark *c* + antiquark *c̄*)

Four fundamental interactions

**Electro-
magnetism**

**Weak
Interaction**

**Strong
Interaction**

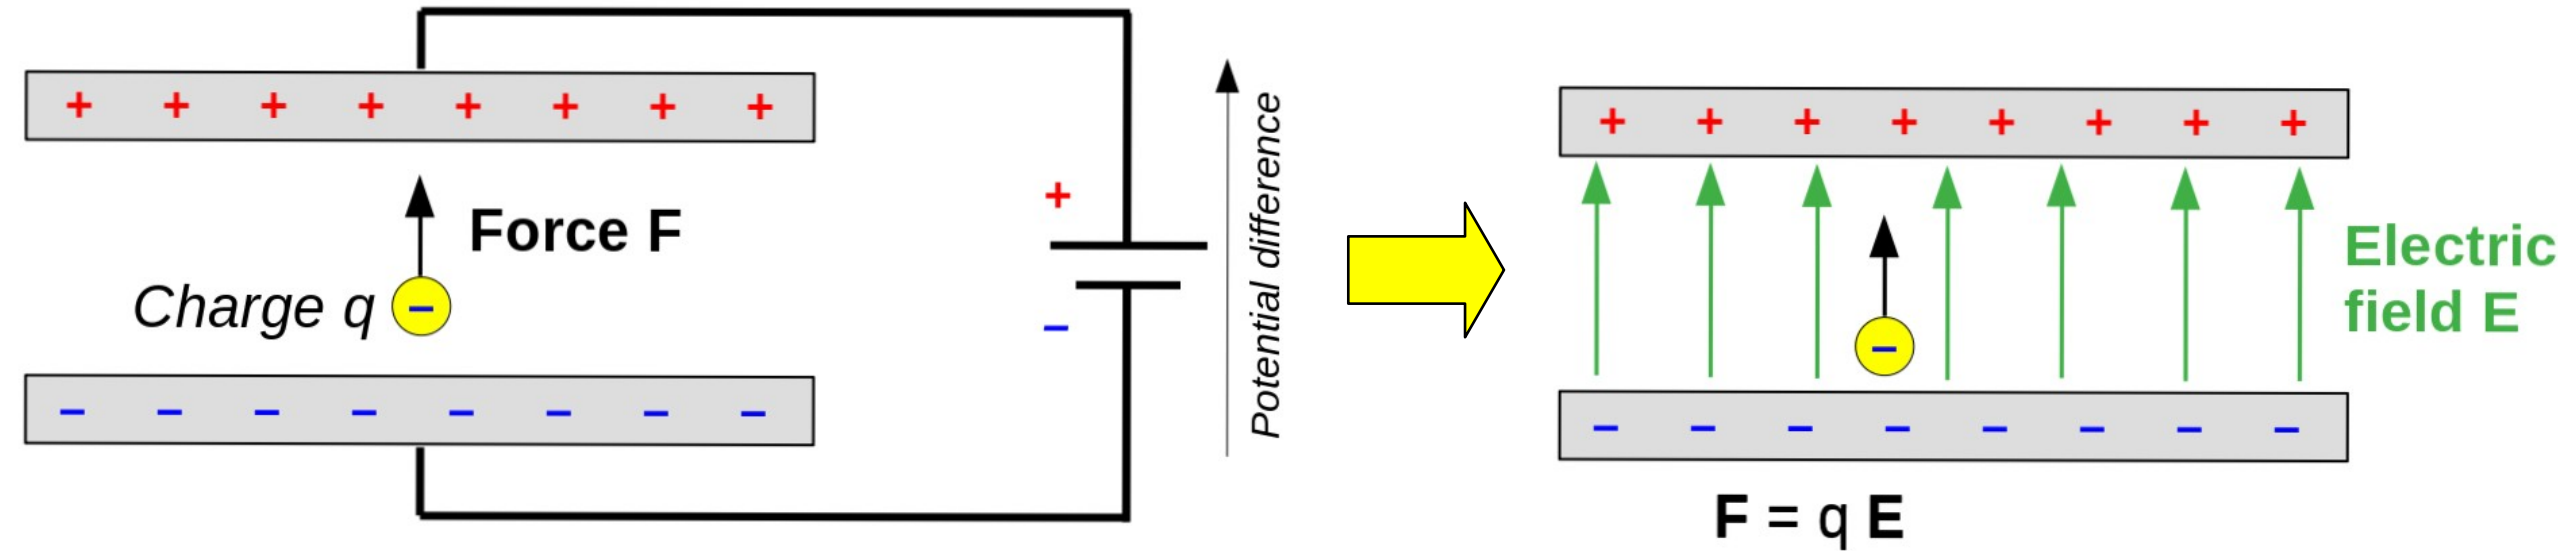

Gravitation

Forces, fields, and particles

- Forces are described via “fields,” e.g. electric field:

- Force \mathbf{F} and electric field \mathbf{E} are related: $\mathbf{F} = q \mathbf{E}$
- Electric charge q = how much a particle interacts with the electric field

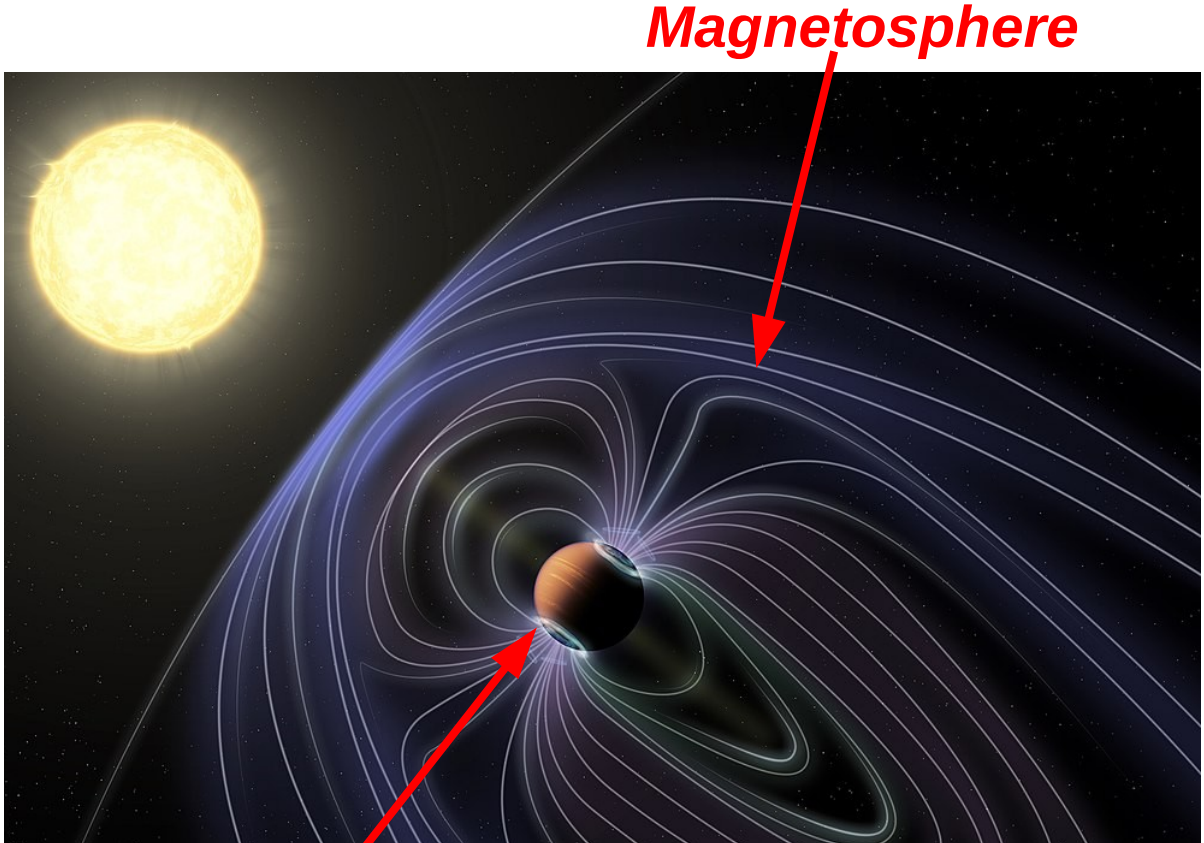

Forces, fields, and particles

Field lines can be visualised, e.g. with magnetic field

Magnetite powder, following magnetic field lines

[Figure source]

Aurora

[Figure source]

Forces, fields, and particles

- Mathematical language of Particle Physics = **Quantum Field Theory**
→ fields are “**quantised**”
- Quanta of a field = particle
- E.g. a quanta of the electromagnetic field is a photon (“light particle”)

Two electrons repulse each other via electromagnetic interaction

*Feynman diagram for this process, force (repulsion) mediated by **exchange of photon***

Known particles – so far

Three Generations
of Matter (Fermions)

	I	II	III	
mass →	2.4 MeV/c ²	1.27 GeV/c ²	171.2 GeV/c ²	0
charge →	2/3	2/3	2/3	0
spin →	1/2	1/2	1/2	1

	1/2	1/2	1/2	1
Leptons	e electron	μ muon	τ tau	W[±] W boson

Gauge Bosons

- **Force mediators = gauge bosons**
 - electromagnetic (EM) interactions → *photons*
 - strong interactions → *gluons*
→ discovered here in HH at DESY's PETRA collider!
 - weak interactions → *W and Z bosons*
- **Matter = fermions (quarks and leptons)**
 - *leptons*: electron, muon, tau, neutrinos
→ sensitive to EM and weak forces only
 - *quarks*: making up baryons (proton, neutron, etc.) and mesons
→ sensitive to strong, EM, weak forces

 - *leptons*: electron, muon, tau, neutrinos
→ sensitive to EM and weak forces only
 - *quarks*: making up baryons (proton, neutron, etc.) and mesons
→ sensitive to strong, EM, weak forces
- One more particle: the Higgs boson

Symmetries and masses of elementary particles

- Symmetries (exact or approximate) play a central role in how we construct **theories** to describe Nature
- E.g., space-time symmetries: the laws of Nature are the same at any point of space and time

- **Problem:** fundamental symmetry of theory in particle physics does not allow masses for particles

- However, **most elementary particles** (except photons and gluons) **have a mass**

- E.g. electron: $511 \text{ keV}/c^2 \sim 9.11 \times 10^{-31} \text{ kg}$
If the electron had no mass, it would fly at the speed of light → no atoms, no electricity, no chemistry...
- Weak interactions have a very short range ($\sim 10^{-15} \text{ m}$), as opposed to electromagnetism
→ W and Z bosons (mediators of weak interactions) must be massive

- **How can elementary particles obtain masses, without breaking the fundamental symmetry of Nature?**

Spontaneous symmetry breaking

- *Idea:* theory preserves the symmetry, but the state of lowest energy does not
→ **spontaneous symmetry breaking**
- Many examples in Nature: ferromagnets, superconductors, daily life, ...

Example 1:

Example 2:

Example 3:

Brout-Englert-Higgs mechanism and the Higgs particle

[Brout, Englert 1964], [Higgs 1964], [Guralnik, Hagen, Kibble 1964], ...

- Introduce a new field, filling all of space: the **Higgs field**
- Give it a particular potential energy
→ Mexican hat/wine bottle shape
- Potential respects symmetry of theory but state of lowest energy, the **vacuum** (in which we live), does not
- Quanta of Higgs field = Higgs boson

Brout-Englert-Higgs mechanism

(how particles acquire their masses)

$$m = g v$$

Mass of elementary particle

How strongly does the particle interact with the Higgs field

"Higgs vacuum expectation value,"
i.e. a constant which is a
fundamental property of vacuum

Analogy for BEH mechanism 1: a famous scientist in a room

*Imagine a room full of scientists
↔ Higgs field*

Analogy for BEH mechanism 1: a famous scientist in a room

Suddenly, Einstein (\leftrightarrow a particle) arrives. He wants to cross the room

Analogy for BEH mechanism 1: a famous scientist in a room

*As Einstein walks through the room,
many scientists interact with him and
slow him down
(↔ the particle gets a mass from
interacting with the Higgs field)*

Analogy for BEH mechanism 1: a famous scientist in a room

As Einstein walks through the room,
many scientists interact with him and
slow him down
(↔ the particle gets a mass from
interacting with the Higgs field)

$$m = g v$$

How fast Einstein can walk
(how "heavy" is he)

How famous Einstein is
(how strongly the scientists want to
interact with him)

How many scientists
are in the room
(if no one, Einstein
is never slowed)

Analogy for BEH mechanism 2: a trip in the snow

Snow ↔ Higgs field
Person/animal ↔ particle

$m = g v$

How fast can one go in the snow
(light → fast;
heavy → slow)

How deep does one step in
(interact with) the snow

How deep is the snow
(no snow
→ no slowdown)

Light / fast

Heavy / slow

2012: discovery of a Higgs boson at CERN

- In collisions at CERN Large Hadron Collider (LHC), experimentalists can search for production of Higgs bosons (particle associated with Higgs field)

Example of process involving a Higgs boson, decaying to 4 leptons

[source: Encyclopaedia Britannica]

- 2012: ATLAS and CMS collaborations at CERN announced the discovery of a Higgs boson, with a mass of about 125 times that of a proton (or half the mass of an atom of uranium)
- Confirms the idea of Brout, Englert, Higgs, ... almost 50 years after their articles

2012: discovery of a Higgs boson at CERN

- In collisions at CERN Large Hadron Collider (LHC), experimentalists can search for production of Higgs bosons (particle associated with Higgs field)

Example of process involving a Higgs boson, decaying to 4 leptons

[source: Encyclopaedia Britannica]

- 2012: ATLAS and CMS collaborations at CERN announced the discovery of a Higgs boson with a mass of about 125 times that of a proton (or 125 GeV/c²)
- Confirms the idea of Brout, Englert, Higgs, ... almost 50 years ago

2013 Nobel Prize for Englert and Higgs (1929-2024)

Does the Brout-Englert-Higgs mechanism occur in Nature?

➤ Can we verify that $m = g v$?

→ confirmed so far for W and Z bosons (mediators of weak interactions) and heaviest fermions

Is this all there is to know?

Is this all there is to know?

Is this all there is to know?

Much remains to understand/discover!

- **How many Higgs bosons** are there?
 - What is the **origin and the shape of the Higgs potential**?
 - Is the vacuum, in which we live, **stable? metastable? unstable?**
 - What is **dark matter**? What is **dark energy**?
 - Why is there **more matter than antimatter** in the Universe?
- and many many more...

Dark Matter and the Higgs boson

The Bullet Cluster, an example of evidence for dark matter

- 95% of the Universe today consists of **dark matter** and **dark energy**, both of which we know almost nothing of
- Dark matter only interacts very weakly with normal matter, but it could interact more with the Higgs boson, e.g. “**Higgs portal**”

The Higgs boson and the early Universe

- Early Universe: high temperature → vacuum is symmetric
- As the Universe cools, a broken phase appears → spontaneous symmetry breaking
- This transition is called the ***Electroweak Phase Transition***
- We now know it occurred, but ***not how it did***
 - Continuous phase transition?
 - Discontinuous phase transition? (Like boiling water, for example)
 - could help explain asymmetry between matter and antimatter in the Universe
 - possible effects in early Universe such as gravitational waves
- Dynamics of phase transition at the interface of Higgs physics and early-Universe evolution

Figure from [Jinno, Konstandin, Rubira '20] and [Servant '22]

Exciting times ahead

- **Direct searches**: try to produce new particles, directly, at LHC at CERN
 - **Indirect searches**: look for deviations in properties of known particles, like the Higgs boson, caused by new phenomena/particles, via precision measurements at LHC and possible future colliders (ILC, FCC, HALHF, ...)
 - Direct and indirect searches for dark matter
 - Gravitational waves searches (LIGO/VIRGO, LISA, ...)
 - Precision measurements at low energies
- Etc.

→ much more to learn ahead of us, through interplay of **experiment** and **theory**

→ experimentalists devise, operate, and analyse data from wide range of experiments

→ theorists devise theories to solve unanswered questions and ways to test them

Thank you very much for your attention!

Searching for the Higgs boson at CERN

$$E = m c^2$$

Energy Mass Speed of light (for a particle at rest)

- Collide protons at very high energy: currently at **13.6 TeV** (each proton has the same kinetic energy as a flying mosquito*)
- kinetic energy converted to mass
 - produce heavy particles during collisions
 - heavy particles decay quickly, but their decay products can be detected and analysed
 - reproduce conditions in very early Universe

*: a mosquito is ~1 million billion billion (10^{24}) times heavier than a proton
