

# Positrons and Electrons at HERA and HERMES

Caroline Riedl

International Workshop on Positrons  
at Jefferson Lab  
Newport News, VA, March 25, 2009

- Motivation: what can we learn from different beam charges?
- HERA: a storage ring for electrons and positrons
- HERMES: azimuthal asymmetries in Deeply Virtual Compton Scattering (DVCS)
- HERMES: search for a two-photon exchange signal

# Motivation: Physics with two beam charges

- Electromagnetic coupling ✓
  - ▶ Usually, cross-section  $\propto |\mathcal{T}|^2$  ▶ beam charge dependence squared out
  - ▶ Need interference process involving odd number of couplings beam!
    - ★ Example 1: DVCS / Bethe-Heitler interference
    - ★ Example 2: transverse single-spin asymmetries from interference of 1-photon and 2-photon exchange amplitudes
- Electroweak coupling ✓
  - ▶ Gauge bosons  $W^\pm$  carry electric charge ▶ not flavor-blind
  - ▶ Beam charge generates sensitiveness to quark flavor
- QCD, Gravitation, Higgs ✗

# HERA at DESY (Hamburg)

# HERA & preaccelerators

Leptons ( $e^+ / e^-$ ): 40 mA

Protons: 90 mA

27.6 GeV

920 GeV

- Life time: longer for positron beam ( $e^+$  push out residual gas cores)

# HERA fills and bunch structure

Protons [mA]  
Positrons [mA]  
Life time [h]

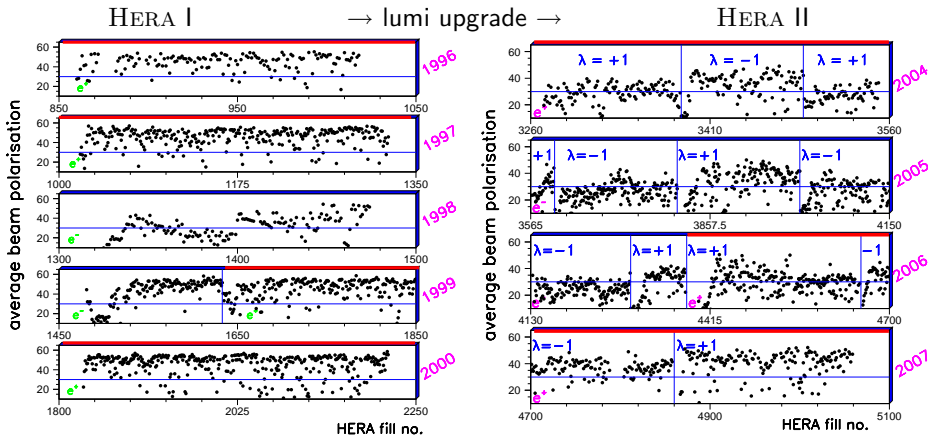

## Positrons:

- 180 bunches (max.220)
- Bunch length 27 ps
- Separated by 96 ns

# HERA and lepton beam polarization

# HERA's beam polarization over the years ( $e^+$ , $e^-$ )

- Beam-beam effects: ( $e^-$ -p) beam focussing, ( $e^+$ -p) defocussing
- Polarization lower after HERA lumi upgrade
  - ▶ Tune was optimized for luminosity and not lepton polarization
- Accuracy of measurement: 2% (sys)

# Physics with two beam charges

# DVCS at HERMES

Statistics 1996-2005 on gas targets:  
**hydrogen**: 25.000 DVCS events  
 unpolarized **deuterium**: 15.000 DVCS events

$$e^{\pm} N \rightarrow e^{\pm} N \gamma$$

$$N \in \{p, d\}$$

# DVCS/Bethe-Heitler interference in $eN \rightarrow eN\gamma$

$$\frac{d^4\sigma}{dQ^2 dx_B dt d\phi} = \frac{y^2 x_B}{32(2\pi)^4 Q^4 \sqrt{1 + \frac{4M^2 x_B^2}{Q^2}}} (|\mathcal{T}_{\text{DVCS}}|^2 + |\mathcal{T}_{\text{BH}}|^2 + \mathcal{I})$$

# Azimuthal dependences in $eN \rightarrow eN\gamma$

Fourier expansion in  $\phi$  for

- **beam polarization**  $P_B$
- **beam charge**  $C_B$
- **unpolarized target:**

$$|\mathcal{T}_{\text{BH}}|^2 = \frac{K_{\text{BH}}}{\mathcal{P}_1(\phi)\mathcal{P}_2(\phi)} \sum_{n=0}^2 c_n^{\text{BH}} \cos(n\phi)$$

$$|\mathcal{T}_{\text{DVCS}}|^2 = K_{\text{DVCS}} \left[ \sum_{n=0}^2 c_n^{\text{DVCS}} \cos(n\phi) + P_B \sum_{n=1}^1 s_n^{\text{DVCS}} \sin(n\phi) \right]$$

$$\mathcal{I} = \frac{C_B K_{\mathcal{I}}}{\mathcal{P}_1(\phi)\mathcal{P}_2(\phi)} \left[ \sum_{n=0}^3 c_n^{\mathcal{I}} \cos(n\phi) + P_B \sum_{n=1}^2 s_n^{\mathcal{I}} \sin(n\phi) \right]$$

# Measured Azimuthal Asymmetries in $eN \rightarrow eN\gamma$

- Born cross-section:

$$\sigma(\phi; P_B, C_B) = \sigma_{UU}(\phi) \cdot [1 + P_B \mathcal{A}_{LU}^{\text{DVCS}}(\phi) + C_B P_B \mathcal{A}_{LU}^{\mathcal{I}}(\phi) + C_B \mathcal{A}_C(\phi)]$$

- **Beam Spin Asymmetries:**

$$\mathcal{A}_{LU}^{\text{DVCS}}(\phi) = \frac{1}{\mathcal{D}(\phi)} \cdot \frac{x_B^2 t \mathcal{P}_1(\phi) \mathcal{P}_2(\phi)}{Q^2} s_1^{\text{DVCS}} \sin(\phi)$$

$$\mathcal{A}_{LU}^{\mathcal{I}}(\phi) = \frac{1}{\mathcal{D}(\phi)} \cdot \frac{x_B}{Q^2} [s_1^{\mathcal{I}} \sin(\phi) + s_2^{\mathcal{I}} \sin(2\phi)]$$

- **Beam Charge Asymmetry:**

$$\mathcal{A}_C(\phi) = -\frac{1}{\mathcal{D}(\phi)} \cdot \frac{x_B}{y} [c_0^{\mathcal{I}} + c_1^{\mathcal{I}} \cos(\phi) + c_2^{\mathcal{I}} \cos(2\phi) + c_3^{\mathcal{I}} \cos(3\phi)]$$

- Dilution factor through lepton propagators  $\mathcal{P}_1(\phi)$ ,  $\mathcal{P}_2(\phi)$ :

$$\mathcal{D}(\phi) = \frac{\sum_{n=0}^2 c_n^{\text{BH}} \cos(n\phi)}{(1 + \epsilon^2)^2} + \frac{x_B^2 t \mathcal{P}_1(\phi) \mathcal{P}_2(\phi)}{Q^2} \sum_{n=0}^2 c_n^{\text{DVCS}} \cos(n\phi)$$

# From Azimuthal Asymmetries to GPDs

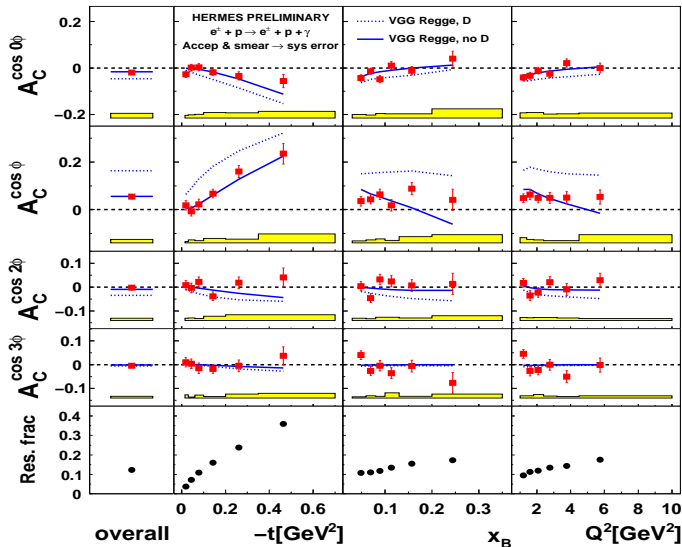

- To obtain Fourier coefficients = asymmetry amplitudes:
  - ▶ Data with different beam charges and beam helicities are combined and **fit simultaneously**
- Connection to GPDs (leading contributions):

$$\begin{aligned}c_1^{\mathcal{I}} &\propto \frac{\sqrt{-t}}{Q} \operatorname{Re} \left[ F_1 \mathcal{H} + \xi(F_1 + F_2) \tilde{\mathcal{H}} - \frac{t}{4M^2} F_2 \mathcal{E} \right] \\ &\propto -\frac{Q}{\sqrt{-t}} c_0^{\mathcal{I}} \quad \leftarrow \text{constant term} \\ s_1^{\mathcal{I}} &\propto \frac{\sqrt{-t}}{Q} \operatorname{Im} \left[ F_1 \mathcal{H} + \xi(F_1 + F_2) \tilde{\mathcal{H}} - \frac{t}{4M^2} F_2 \mathcal{E} \right]\end{aligned}$$

- $\mathcal{H}, \tilde{\mathcal{H}}, \mathcal{E}, \tilde{\mathcal{E}}$ : COMPTON form factors  
= convolutions of hard scattering amplitude and twist-2 GPDs  $H, \tilde{H}, E, \tilde{E}$
- $F_1$ : DIRAC,  $F_2$ : PAULI form factor of the nucleon

# HERMES DVCS $A_C$ on a hydrogen target

All data  
1996-2005

constant term

$$\propto -A_C^{\cos \phi}$$

$$\propto \text{Re}[F_1 \mathcal{H}]$$

[higher twist]

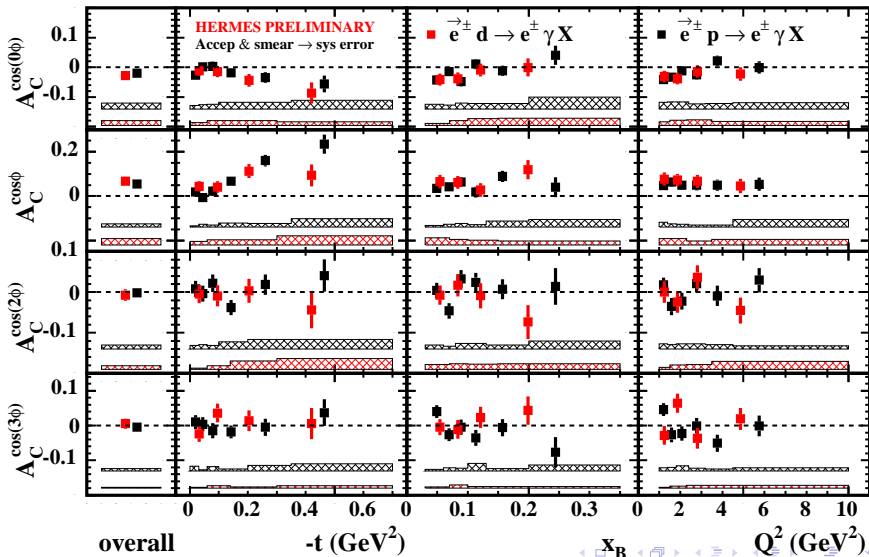

[gluon leading twist]

Resonant fraction

$$ep \rightarrow e\Delta^+\gamma$$

# HERMES DVCS $A_C$ : $H_2$ vs. $D_2$ target

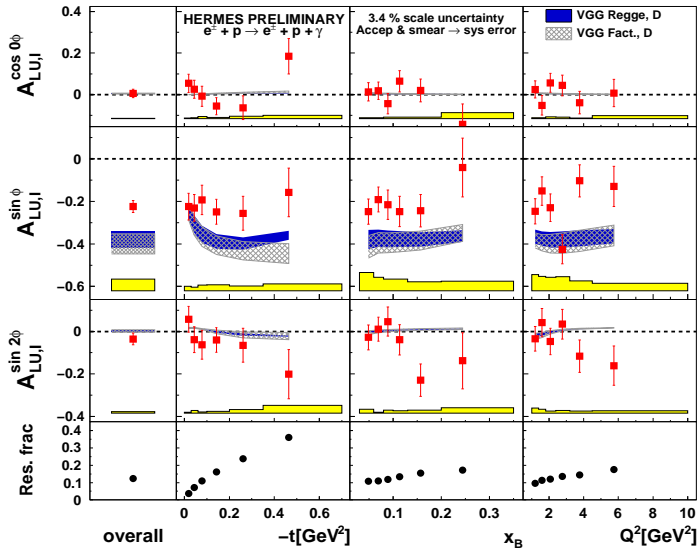

All data  
1996-2005

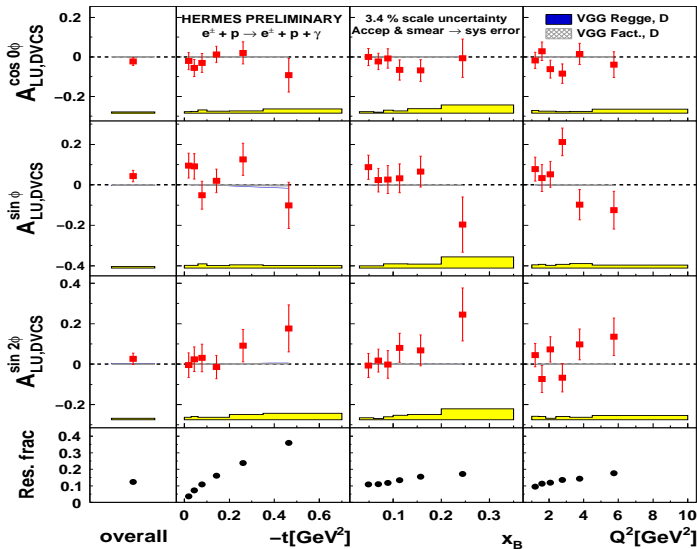

# HERMES DVCS $A_{LU}^I$ on a hydrogen target

All data  
1996-2005

# HERMES DVCS $A_{LU}^{DVCS}$ on a hydrogen target

All data  
1996-2005

$\propto [\mathcal{H}\mathcal{H}^* + \tilde{\mathcal{H}}\tilde{\mathcal{H}}^*]$

$\leftarrow$  [higher twist]

Resonant fraction

# Two-Photon exchange contribution in DIS?

- Hint for two-photon exchange so far only in elastic ep-scattering
  - Discrepancy in FF measurements:  $2\gamma$ -exchange as explanation?

- Transverse single-spin asymmetry  $\mathcal{A}_{UT}$  in inclusive DIS
  - Forbidden in one-photon exchange approximation
  - Caused by interference of multi-photon exchange with one-photon exchange (A. Metz *et al.*, *Phys.Lett.B* **643**, 319-324, 2006)

- $\sigma^{\uparrow\downarrow} \propto \vec{S} \cdot (\vec{k} \times \vec{k}')$

- Measure left-right asymmetry  $A_N$  or sine-modulation  $A_{UT}^{\sin \phi}$
- $\mathcal{A}_{UT}$  expected to be  $\mathcal{O}(\alpha_{em} M_{pol}/Q) \approx 0.01$ . Sign switch for  $e^{\pm}$ !

# Measurement of left-right asymmetry at HERMES

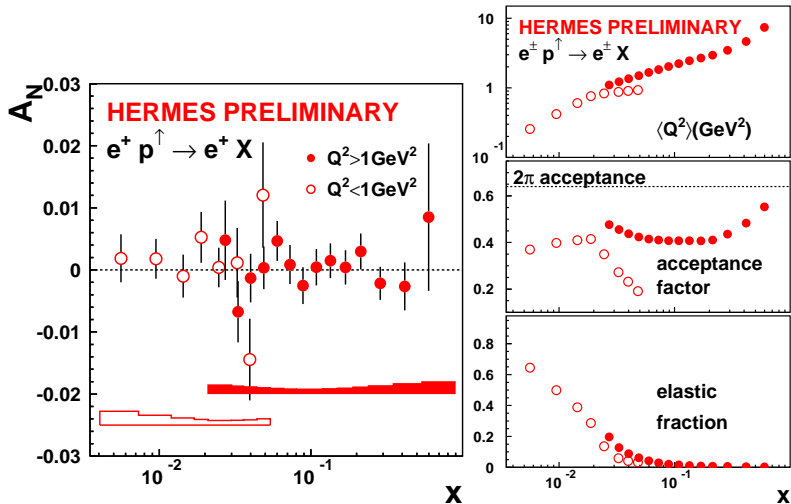

- Inclusive measurement
- Transversely polarized hydrogen target with polarization  $P^{\uparrow\downarrow}$
- Positron and electron data
- Beam helicity balancing
- Expr. for  $A_N$ : false asymmetries due to acceptance cancel

$$A_N = \frac{\sqrt{\frac{N_R^\uparrow}{L_P^\uparrow} \frac{N_L^\downarrow}{L_P^\downarrow}} - \sqrt{\frac{N_L^\uparrow}{L_P^\uparrow} \frac{N_R^\downarrow}{L_P^\downarrow}}}{\sqrt{\frac{N_R^\uparrow}{L_P^\uparrow} \frac{N_L^\downarrow}{L_P^\downarrow}} + \sqrt{\frac{N_L^\uparrow}{L_P^\uparrow} \frac{N_R^\downarrow}{L_P^\downarrow}}} = A_{\text{true}} \left( 1 + \frac{P^\uparrow - P^\downarrow}{P^\uparrow + P^\downarrow} \right) \approx A_{\text{true}}$$

- Systematics:

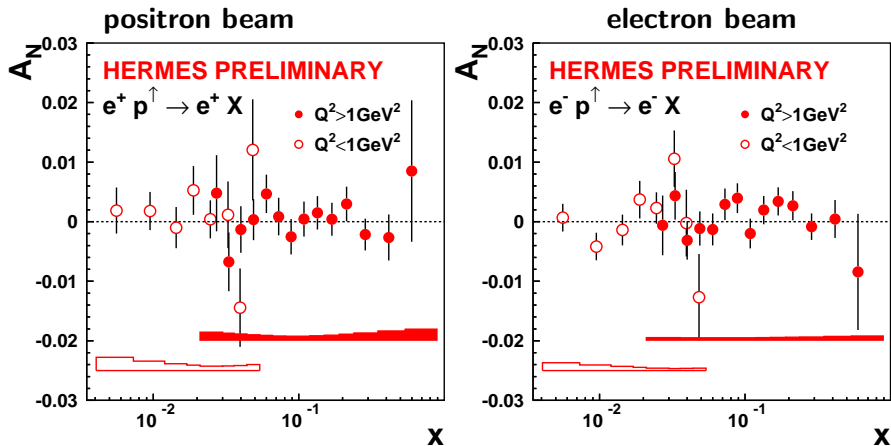

- ▶ Particle identification; trigger efficiencies; target polarization
- ▶ Correction for  $e^+/e^-$  bending in magnetic dipole field of transv. target
- ▶ Effects of misalignment of detector and beam

# HERMES inclusive left-right asymmetry

Acceptance scaling factor due to not full  $2\pi$  coverage in  $\phi$

# HERMES inclusive left-right asymmetry

For both beam charges consistent with 0!

# Summary and Outlook

- Data with two beam charges offer extraction of interesting physics
- Provide odd number of couplings to beam charge
  - ▶ E. g. DVCS/Bethe-Heitler interference term sensitive to beam charge
- DVCS azimuthal asymmetries at HERMES
  - ▶ Help to constrain GPD models
    - ★  $\mathcal{A}_C$  and  $\mathcal{A}_{LU}$  provide access to GPD  $H$
    - ★ Data set with transverse target polarization ( $\mathcal{A}_{UT}$ ): access to GPD  $E$  (supressed otherwise)
  - ▶ Provide model-dependent constrain on  $J_u + k \cdot J_d$
- Two-Photon exchange signal at HERMES
  - ▶ Consistent with zero
  - ▶ Publication to come in 2009
- HERMES high lumi data set 2006/2007
  - ▶ Recoil detector to detect recoiling target proton
  - ▶ More data on tape
    - ★ Unpolarized hydrogen: factor of  $\approx 2.5$  more data
    - ★ Unpolarized deuterium: 50% more
  - ▶ Results to come!

# BACKUP

# Exclusivity at HERMES

- 1996-2005: **missing mass technique** for  $ep \rightarrow eX\gamma$  (Monte Carlo)

$X=p$

$X=\Delta^+ \rightarrow \begin{cases} n\pi^+ \\ \rho\pi^0 \end{cases}$

$X=\pi^0 + ..$

- With the **Recoil Detector** (2006/2007): tag exclusive events

- ▶ Identify recoiling protons
- ▶ Identify particles from background processes

$\Rightarrow$  semi-inclusive DIS: 3%  $\searrow \ll 1\%$ , **resonant**: 12%  $\searrow 1\%$

# Corrections ✓ and systematic uncertainties ■

- (✓, ■) Shift of exclusive peak between  $e^-$  and  $e^+$  data (small)
- (✓, ■) Semi-inclusive and exclusive background  
⇒ Fractions from Monte Carlo
- (■) Acceptance, bin-width, smearing and detector misalignment (main contribution)  
⇒ Estimated from Monte Carlo simulation employing range of available models  
⇒ Model dependence
- The contributions from the resonance region, e.g.

$$eN \rightarrow e\Delta^+\gamma$$

stays part of the signal, in average 12%!

The underlying **“associated” asymmetry is unknown!**

# Acceptance, bin-width, smearing and misalignment effects

The difference between “model-generated” and in the HERMES acceptance reconstructed MC amplitudes is taken as systematic uncertainty

# Transverse Target Spin Asymmetry $\mathcal{A}_{UT}(\phi, \phi_s)$

- Reminder: DVCS-BH interference term sensitive to beam charge
- $\mathcal{A}_{UT}$ : the only DVCS asymmetry (on  $p$ ) for which GPD  $E$  is not suppressed
- Ji relation: access to total angular momentum of quarks  

$$J_q = \frac{1}{2} \lim_{t \rightarrow 0} \int_{-1}^1 dx x [H_q(x, \xi, t) + E_q(x, \xi, t)]$$

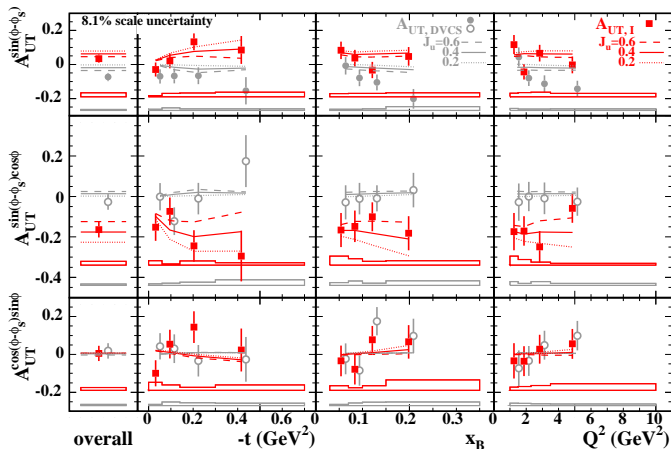

$$A_{UT}^T(\phi, \phi_s) \propto [d\sigma^+(\phi, \phi_s) - d\sigma^-(\phi, \phi_s)] - [d\sigma^+(\phi, \phi_s + \pi) - d\sigma^-(\phi, \phi_s + \pi)]$$

$$A_{UT}^T(\phi, \phi_s) \propto \text{Im}(F_2 \mathcal{H} - F_1 \mathcal{E}) \sin(\phi - \phi_s) \cos \phi + \text{Im}(F_2 \tilde{\mathcal{H}} - (F_1 + \xi F_2) \tilde{\mathcal{E}}) \cos(\phi - \phi_s) \sin \phi$$

# HERMES $\mathcal{A}_{UT}$ amplitudes

Complete transversely polarized data set

sensitive to  $J_u$ :

$$\text{Im}(F_2\mathcal{H} - F_1\mathcal{E}) \cdot \sin(\phi - \phi_s) \cos(n\phi)$$

$\leftarrow$  NOT sensitive to  $J_u$ :

$$\text{Im}(F_2\tilde{\mathcal{H}} - (F_1 + \xi F_2)\tilde{\mathcal{E}}) \cdot \cos(\phi - \phi_s) \sin\phi$$

Sensitivity on  $J_u$ : GPD-model (VGG), assuming  $J_d = 0$

# Dedicated high lumi run 2006/2007 with Recoil

- Unpolarized  $H_2$  target: 58 Mio DIS (factor of  $\approx 3$  more), Recoil: 38
- Unpolarized  $D_2$  target: 14 Mio DIS (factor of  $> 1$  more), Recoil: 10
- **2 Beam helicities,  $e^+$  and  $e^-$ , Recoil: only  $e^+$**

# The HERMES Recoil Detector

- SC Solenoid (1 Tesla)

- Target Cell with unpol.  $H_2$  or  $D_2$

- Photon Detector

- ▶ 3 layers of Tungsten/Scintillator

- Scintillating Fiber Tracker

- ▶ 2 Barrels

- ▶ Each 2 parallel- & 2 stereo-layers

- Silicon Strip Detector

- ▶ 2 Layers of 16 double-sided sensors

- ▶ (10cm×10cm) active area

- ▶ Inside accelerator vacuum

Silicon & Fiber Tracker:

$p_p \in [135, 1200]$  MeV/c

$p/\pi$  **PID** for  $p < 650$  MeV/c

Photon Detector:

$p/\pi$  **PID** for  $p > 600$  MeV/c

$\pi^0$  background supression

# Exclusivity at HERMES in a nutshell

## GPD access at HERMES:

unpolarized	polarized
photon: $J^P = 1^-$ (DVCS)	
<b>H:</b> $A_C, A_{LU}, A_{UT}$	<b><math>\tilde{H}</math>:</b> $A_{UL}, [A_{UT}]$
<b>E:</b> $A_{UT}$	<b><math>\tilde{E}</math>:</b> $[A_{UT}]$
$J^P = 1^-$ mesons	$J^P = 0^-$ mesons
