

Nuclear medium dependence of transverse Λ polarisation in quasi-real photoproduction

Klaus Rith

University of Erlangen-Nürnberg & DESY

On behalf of the  hermes collaboration

27.5 GeV e^+ / e^- beam of HERA

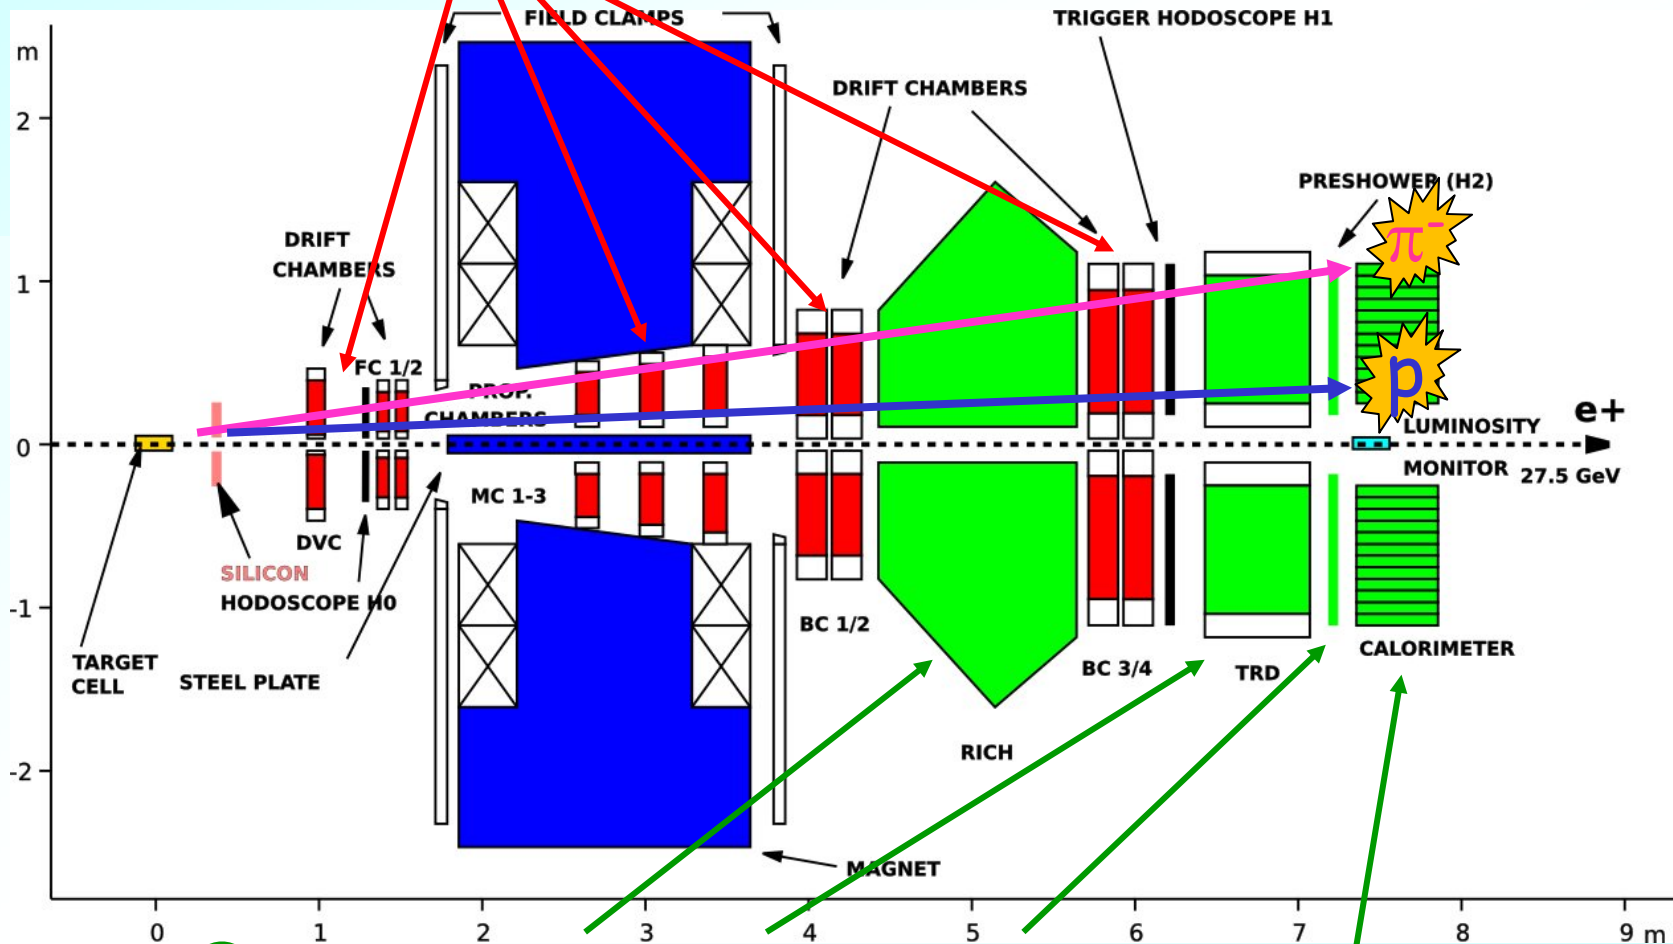

Internal gas targets

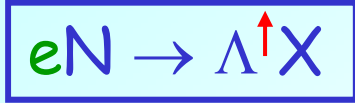

polarized : $^1\text{H}, ^1\text{H}^{\uparrow}, ^2\text{H}, ^3\text{He}$

unpolarized: $^1\text{H}, ^2\text{H}, ^3\text{He}, ^4\text{He}, ^{14}\text{N}, ^{20}\text{Ne}, ^{84}\text{Kr}, ^{131}\text{Xe}$

● tracking: $\delta p/p \sim 2\%$, $\delta\Theta < 0.6$ mrad, 40-220 mrad

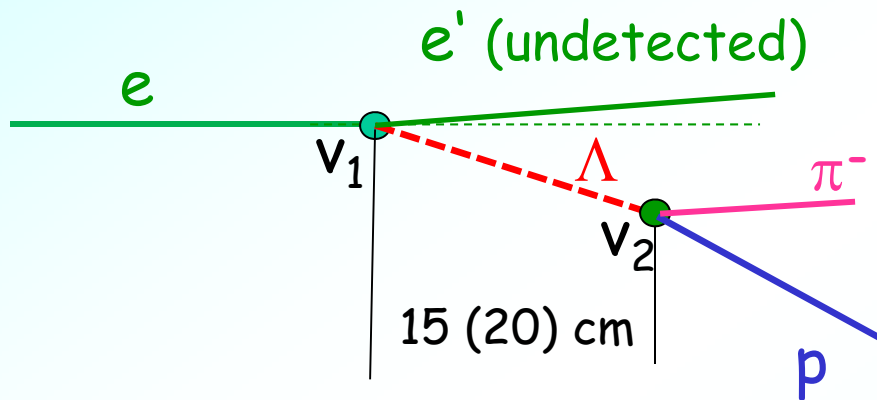

● PID: RICH, TRD, Preshower, Calorimeter
lepton-hadron separation > 98%

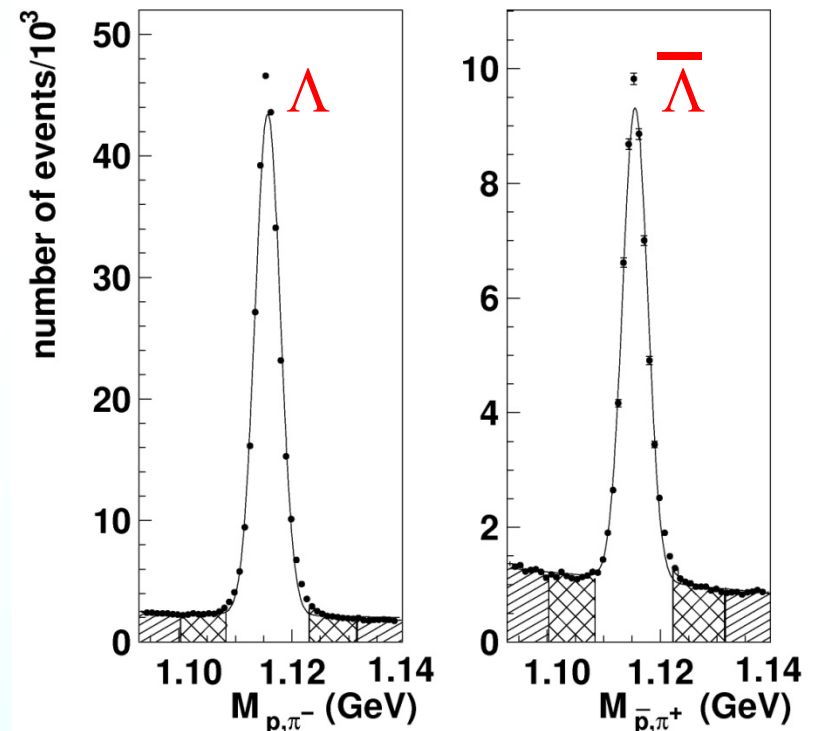

Quasi-real photoproduction

$Q^2 < 0.05 \text{ GeV}^2$ for 80% of events
 $\langle \nu \rangle = 15.6 \text{ GeV}$

Background suppression:
 Cherenkov information +
 vertex cuts

1995-2000 data
 (all targets except Xe)

$N_{\Lambda} \approx 250\text{k}$

$N_{\bar{\Lambda}} \approx 50\text{k}$

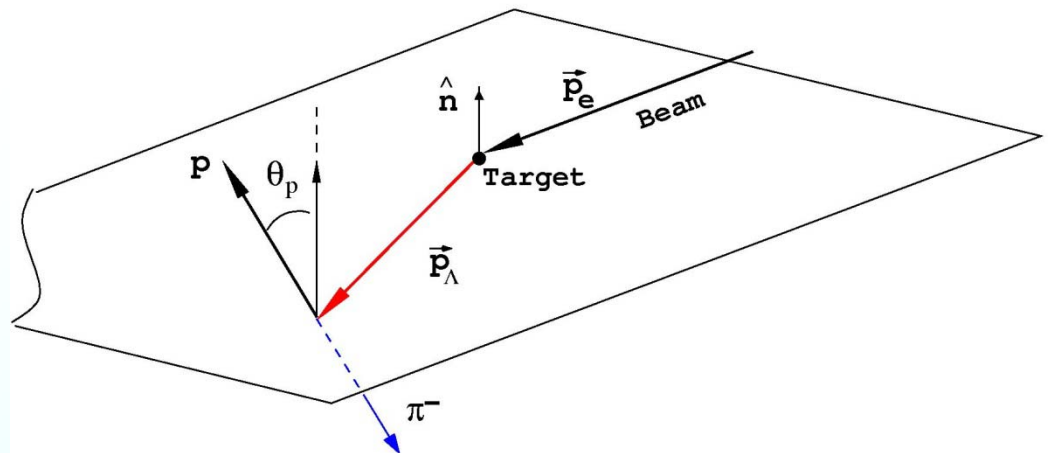

- Parity violating decay $\Lambda \rightarrow \pi^- p$:
 p preferentially emitted along Λ spin

$$\frac{dN}{d\Omega_p} = \frac{dN_0}{d\Omega_p} (1 + \alpha P_\Lambda \cos \theta_p) \quad (\text{in } \Lambda \text{ CMS})$$

$$\alpha = 0.642 \pm 0.013$$

- Unpolarised beam and target ($P_B P_T = 0.0000 \pm 0.0005$):
 Spontaneous polarisation is directed along \hat{n}

$$\vec{P}_\Lambda = P_\Lambda \cdot \hat{n}, \quad \hat{n} = \frac{\vec{p}_e \times \vec{p}_\Lambda}{|\vec{p}_e \times \vec{p}_\Lambda|}$$

Formalism is based on
up/down mirror (geometrical) symmetry of the
detector

$$\langle \cos \theta \rangle_0^{up} = - \langle \cos \theta \rangle_0^{down}$$

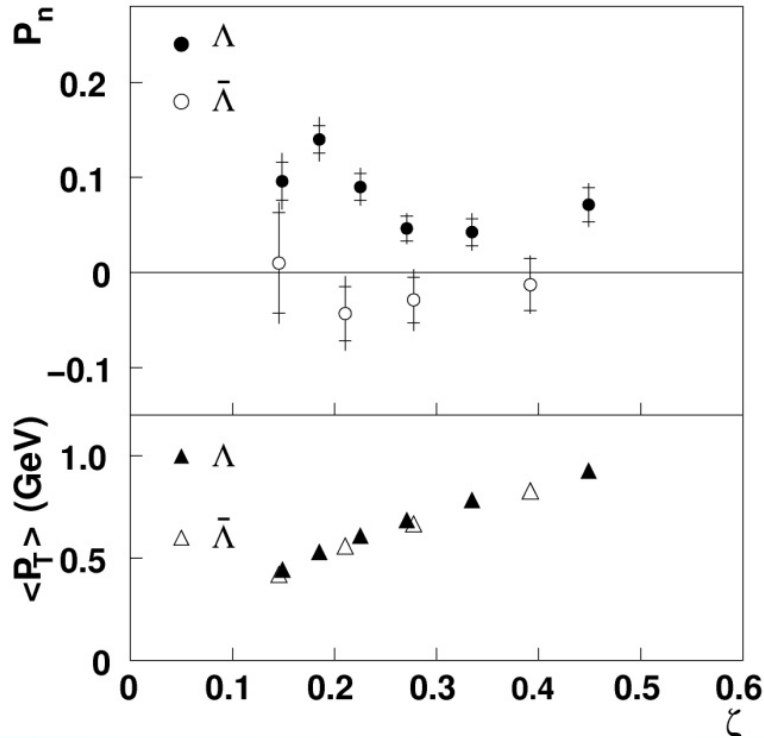

$$P_{\Lambda} = \frac{\langle \cos \theta_p \rangle}{\alpha \langle \cos^2 \theta_p \rangle} = \frac{\frac{1}{N_{\Lambda}} \sum_{i=1}^{N_{\Lambda}} \cos \theta_p}{\alpha \frac{1}{N_{\Lambda}} \sum_{i=1}^{N_{\Lambda}} \cos^2 \theta_p}$$

Kinematical dependences of P_Λ

Phys.Rev.D76 (2007) 092008

1995-2000 data (all targets except Xe)

$$\zeta = (E_\Lambda + p_{z\Lambda}) / (E_e + p_e)$$

ζ and x_F are correlated
 $\zeta > 0.25 \leftrightarrow x_F > 0$

$$\Lambda: P_n = 0.078 \pm 0.006_{\text{stat.}} \pm 0.012_{\text{syst.}}$$

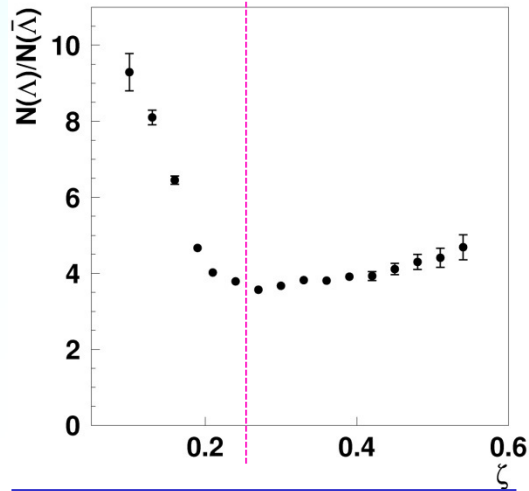

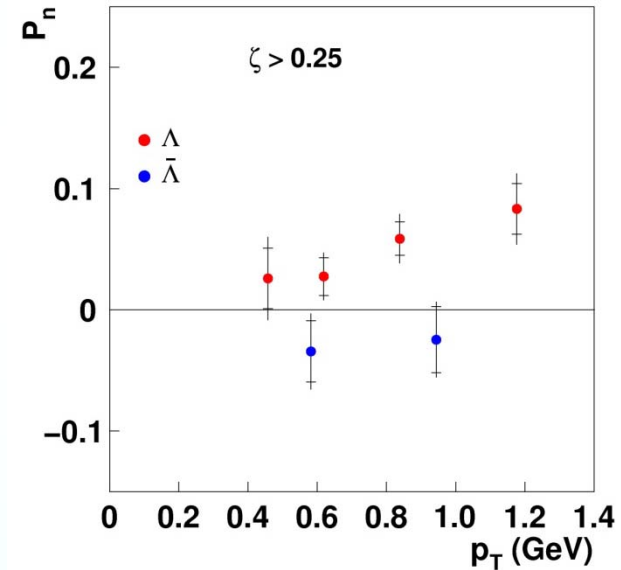

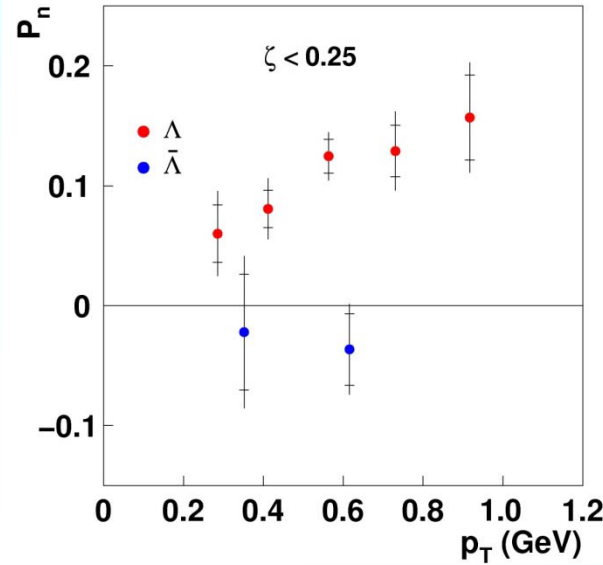

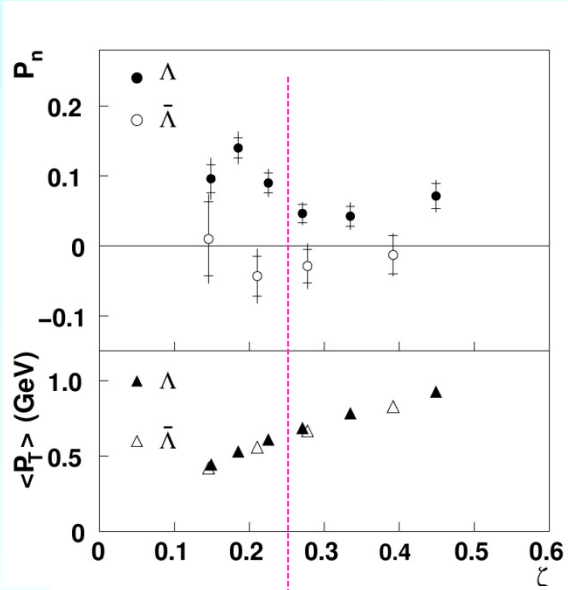

$$\bar{\Lambda}: P_n = -0.025 \pm 0.015_{\text{stat.}} \pm 0.018_{\text{syst.}}$$

- $P_n(\Lambda)$ is positive
- Opposite sign compared to pion and proton beams
- Same sign as for K^- ($\bar{u}s$) and Σ^- (dds) beams
- Origin: s -quark content of γ ?

Kinematical dependences of P_{Λ}

1995-2000 data (all targets except Xe)

Phys.Rev.D76 (2007) 092008

$P_n(\Lambda)$ increases with increasing p_T

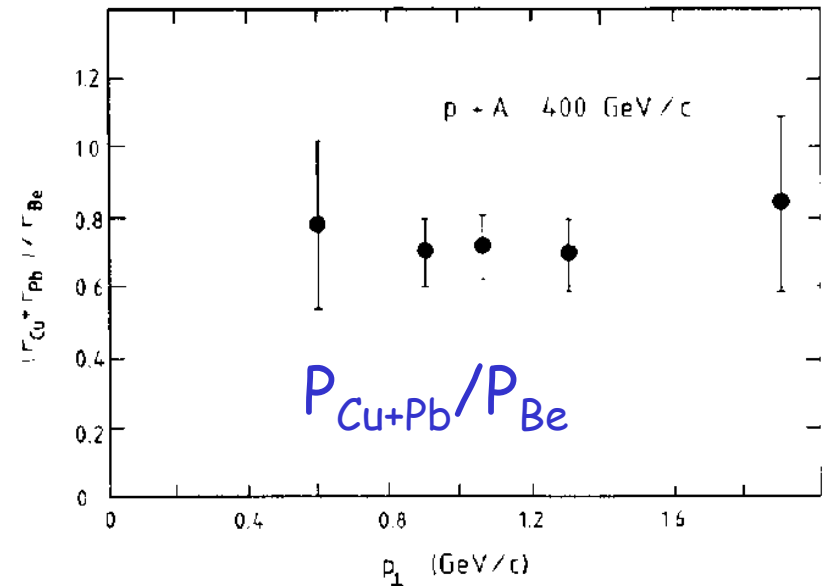

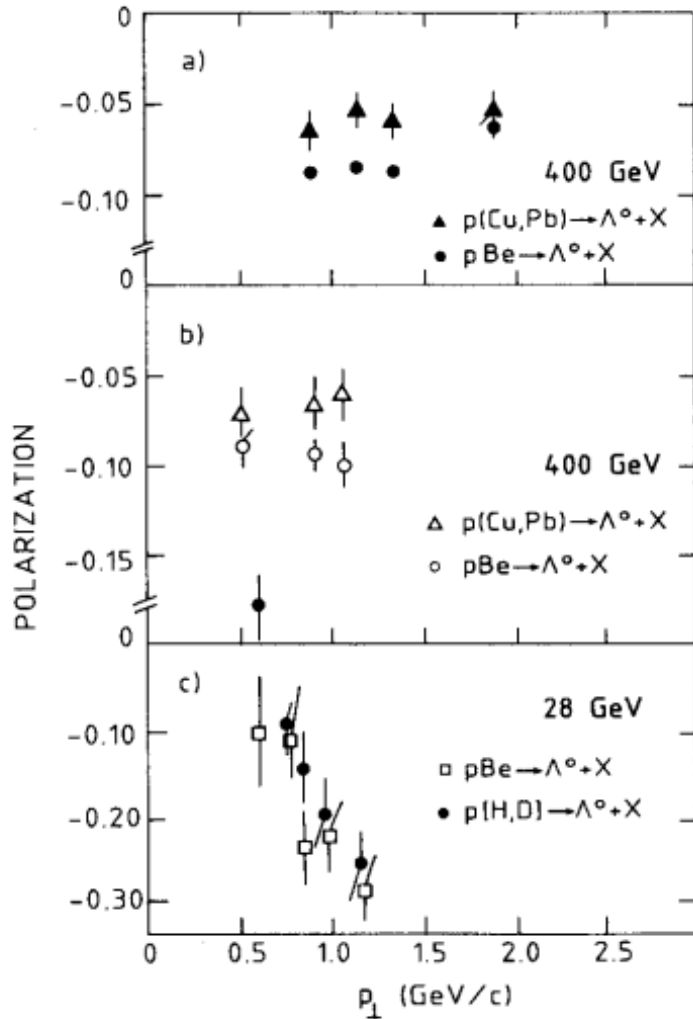

$P_n(\Lambda)$ is larger for low ξ (target fragm.) than for high ξ (current fragmentation)

$$\zeta = (E_{\Lambda} + p_{z\Lambda}) / (E_e + p_e)$$

A dependence in pA collisions

Experiment @ FNAL

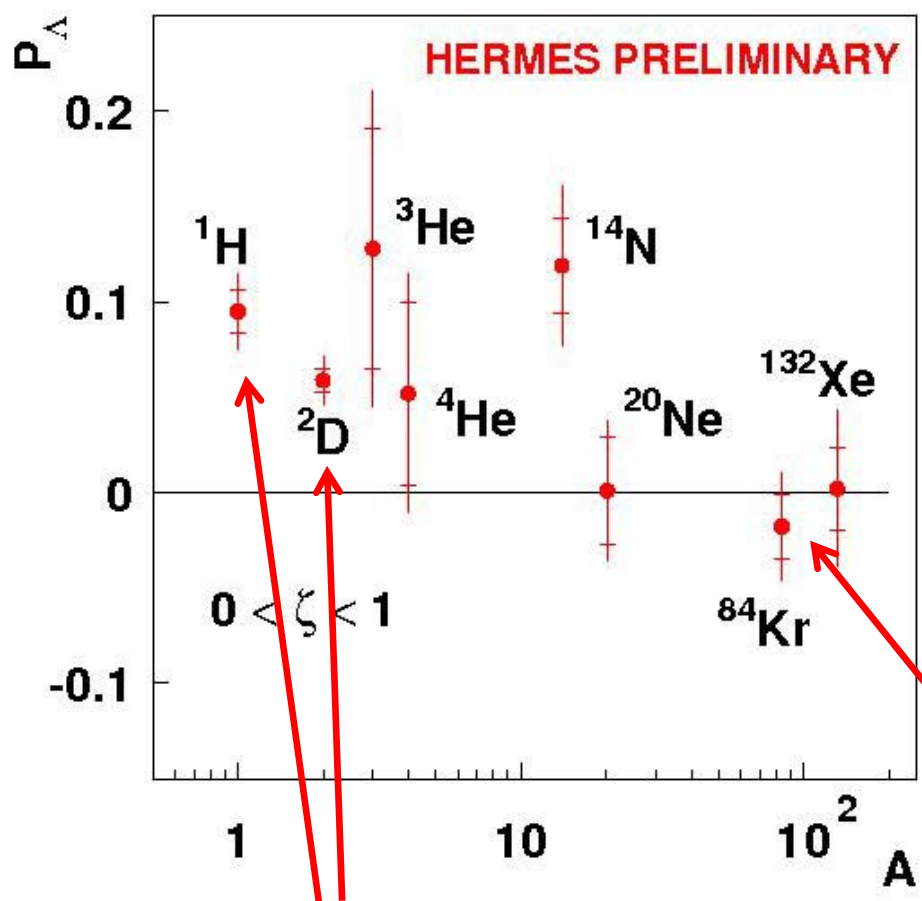

$p A \rightarrow \Lambda X$
 (targets Cu, Pb, Be)
 $p_{\text{beam}} = 400 \text{ GeV}$

Experiment @ BNL

$p A \rightarrow \Lambda X$
 (targets H, D, Be)
 $p_{\text{beam}} = 28 \text{ GeV}$

A dependence of Λ polarisation

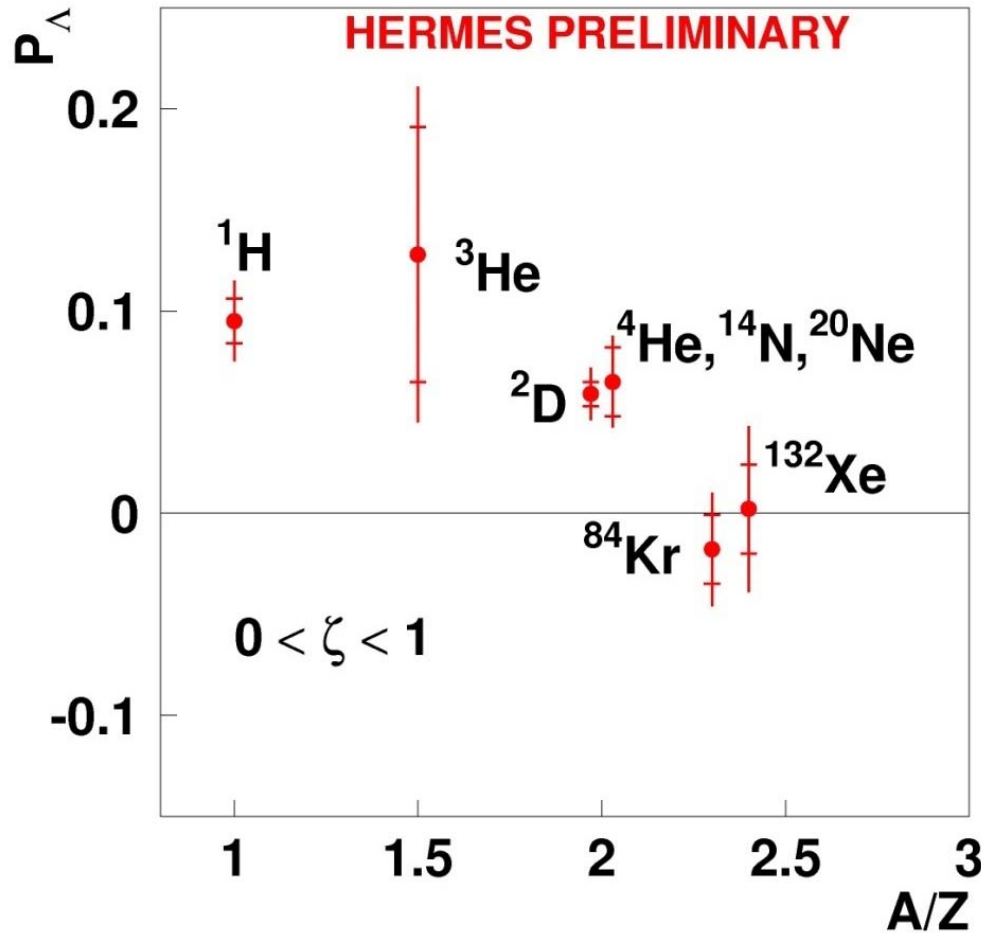

1995-2005 data; $N_{\Lambda} \approx 385\text{k}$
 (50 % more D + 25k Kr, 17k Xe)

$P_{\Lambda}(^1\text{H}) \gg P_{\Lambda}(^2\text{H})$

P_{Λ} compatible with zero for large A

$\rightarrow P_{\Lambda}(n) \ll P_{\Lambda}(p) ?$

A/Z dependence of Λ polarisation

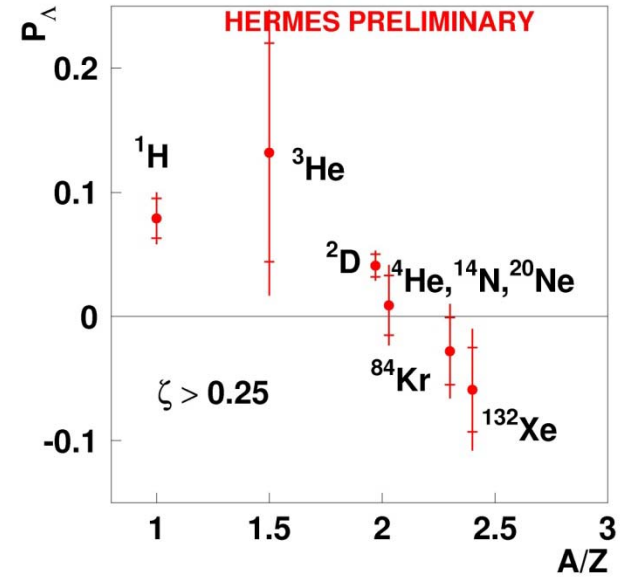

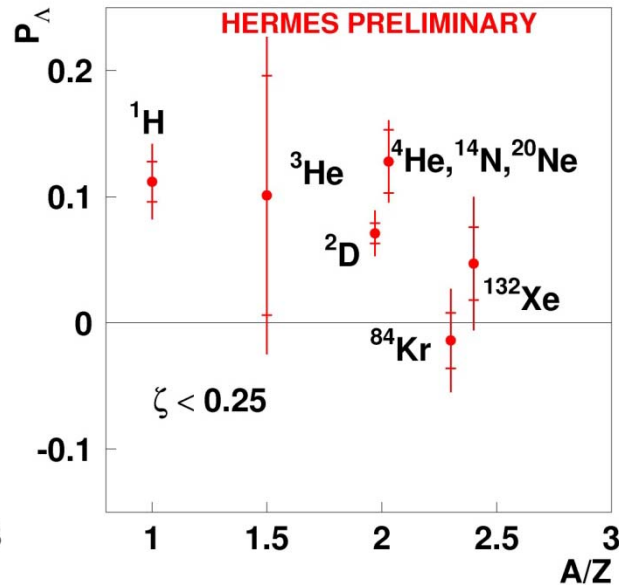

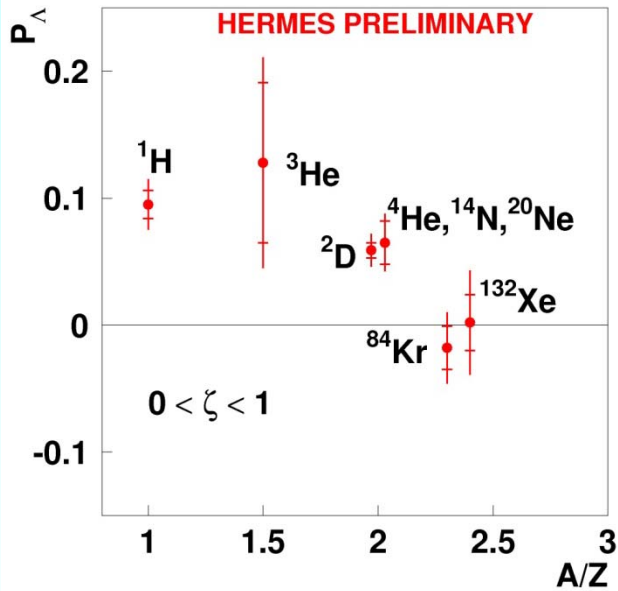

$P_{\Lambda}(n) \ll P_{\Lambda}(p)$ not sufficient to explain vanishing P_{Λ} for large A

Additional nuclear medium effects required for explanation,
 P_{Λ} destroyed by FSI ?

- Transverse Λ polarisation observed in quasi-real photoproduction
- $P_n(\Lambda)$ is positive. Same sign as for K^- (us) and Σ^- (dds) beams. Origin: s -quark content of γ ?
- $P_\Lambda(^1\text{H}) \gg P_\Lambda(^2\text{H}) \longrightarrow P_n(\Lambda)$ for neutrons substantially smaller than for protons ?
- Nuclear medium effects:
 $P_n(\Lambda)$ appears to vanish for large A (A/Z)

A/Z dependence of Λ polarisation

A dependence of Λ polarisation
